Note: The maps in this plan were provided by the City of Rancho Palos Verdes, City of Rolling Hills Estates, County of Los Angeles, Federal Emergency Management Agency (FEMA), or were acquired from public Internet sources. Care was taken in the creation of the maps contained in this Plan, however they are provided "as is." The Cities cannot accept any responsibility for any errors, omissions or positional accuracy, and therefore, there are no warranties that accompany these products (the maps). Although information from land surveys may have been used in the creation of these products, in no way does this product represent or constitute a land survey. Users are cautioned to field verify information on this product before making any decisions.

**FEMA Requirement Citations**

In an effort to assist the readers and Cal OES/FEMA reviewers, the jurisdiction has inserted the FEMA requirement citations pertaining to Plan development. Following is an *example* of a FEMA requirement citation:

**PART IV: APPENDICIES .....**

- APPENDIX A: Benefit/Cost Analysis

# Executive Summary

---

The Multijurisdictional Hazard Mitigation Plan (Plan) was prepared in response to Disaster Mitigation Act of 2000 (DMA 2000). This Plan satisfies mitigation planning requirements for the City of Rancho Palos Verdes and the City of Rolling Hills Estates. DMA 2000 (also known as Public Law 106-390) requires state and local governments to prepare mitigation plans to document their mitigation planning process, and identify hazards, potential losses, mitigation needs, goals, and strategies. This type of planning supplements both Cities comprehensive emergency management programs. This document is a federally mandated update to the 2004 Joint Natural Hazards Mitigation Plan.

Under DMA 2000, each state and local government must have a federally approved mitigation plan to be eligible for hazard mitigation grant funding.

The Disaster Mitigation Act of 2000 (DMA 2000) is intended to facilitate cooperation between state and local governments, prompting them to work together. Through collaboration, mitigation needs can be identified before disasters strike, resulting in faster allocation of resources and more effective risk reduction projects.

The following FEMA definitions are used throughout this Plan:

**Hazard Mitigation** – “Any sustained action taken to reduce or eliminate the long-term risk to human life and property from hazards.”

**Planning** – “The act or process of making or carrying out plans; specifically, the establishment of goals, policies, and procedures for a social or economic unit.”  
(Source: FEMA, 2002, *Getting Started, Building Support for Mitigation Planning*, FEMA 386-1)

The Plan includes resources and information to assist the Cities of Rancho Palos Verdes and Rolling Hills Estates (RPV/RHE - the “planning area”), their residents, public and private sector organizations, and others interested in participating in planning for natural hazards. The Plan provides a list of activities that may assist the Cities in reducing risk and preventing loss from future natural hazard events. The action items address multi-hazard issues, as well as activities for earthquake, wildfire, earth movement (landslide & debris flow), tsunami, and technological and human-caused hazards.

## Mitigation Planning Benefits

Planning ahead helps residents, businesses, and government agencies effectively respond when disasters strike; and keeps public agencies eligible for Hazard Mitigation Grant Program (HMGP) funding. The long-term benefits of mitigation planning include:

- ✓ Greater understanding of hazards faced by a community
- ✓ Use of limited resources on hazards with the greatest effect on a community
- ✓ Financial savings through partnerships for planning and mitigation
- ✓ Reduced long-term impacts and damages to human health and structures, and lower repair costs
- ✓ More sustainable, disaster-resistant communities.

## Hazard Land Use Policy in California

Planning for hazards should be an integral element of any city's land use planning program. All California cities and counties have general plans and the implementing ordinances that are required to comply with the statewide land use planning regulations.

The continuing challenge faced by local officials and state government is to keep the network of local plans effective in responding to the changing conditions and needs of California's diverse communities, particularly in light of the very active seismic region in which we live.

Planning for hazards requires a thorough understanding of the various hazards facing the Cities and region as a whole. Additionally, it's important to take an inventory of the structures and contents of various City holdings. These inventories should include the compendium of hazards facing the Cities, the built environment at risk, the personal property that may be damaged by hazard events and most of all, the people who live in the shadow of these hazards.

## Support for Hazard Mitigation

All mitigation is local and the primary responsibility for development and implementation of risk reduction strategies and policies lies with each local jurisdiction. Local jurisdictions, however, are not alone. Partners and resources exist at the regional, state and federal levels. Numerous California state agencies have a role in hazards and hazard mitigation.

Some of the key agencies include:

- ✓ California Office of Emergency Services (Cal OES) is responsible for disaster mitigation, preparedness, response, recovery, and the administration of federal funds after a major disaster declaration;
- ✓ Southern California Earthquake Center (SCEC) gathers information about earthquakes, integrates information on earthquake phenomena, and communicates this to end-users and the general public to increase earthquake awareness, reduce economic losses, and save lives.
- ✓ California Department of Forestry and Fire Protection (CAL FIRE) is responsible for all aspects of wildland fire protection on private and state properties, and administers forest practices regulations, including landslide mitigation, on non-federal lands.
- ✓ California Division of Mines and Geology (DMG) is responsible for geologic hazard characterization, public education, and the development of partnerships aimed at reducing risk.
- ✓ California Division of Water Resources (DWR) plans, designs, constructs, operates, and maintains the State Water Project; regulates dams; provides flood protection and assists in emergency management. It also educates the public and serves local water needs by providing technical assistance.
- ✓ FEMA provides hazard mitigation guidance, resource materials, and educational materials to support implementation of the capitalized DMA 2000.
- ✓ United States Census Bureau (USCB) provides demographic data on the populations affected by natural disasters.
- ✓ United States Department of Agriculture (USDA) provides data on matters pertaining to land management.

The RPV/RHE Hazard Mitigation Planning Team (Planning Team) consisting of City and County staff from various departments that worked with Emergency Planning Consultants using the following approach to create the 2014 Multijurisdictional Hazard Mitigation Plan:

- ✓ Identify hazards posing a significant threat
- ✓ Profile these hazards
- ✓ Estimate inventory at risk and potential losses associated with these hazards
- ✓ Develop mitigation strategies and goals that address these hazards
- ✓ Develop plan maintenance procedures for implementation after the joint review by Cal OES and FEMA and FEMA approval.

Although the requirements of DMA 2000 only apply to natural hazards, which are the primary focus of this Plan, the Planning Team felt it was important to also identify profile, assess, and mitigate against technological and human-caused hazards.

As required by DMA 2000, the Cities informed the public about the planning process and provided opportunities for public input during the plan writing phase, review phase, and decision-making phase. In addition, key agencies and stakeholders shared their expertise during the planning process. This Plan documents the process, outcome, and future of the Cities mitigation planning efforts.

## How is the Plan Organized?

The structure of the Plan enables people to use a section of interest to them and allows the Cities of RPV/RHE to review and update sections when new data is available. The ease of incorporating new data into the Plan will result in a Plan that remains current and relevant to RPV/RHE.

### **Part I: Background**

#### **Executive Summary**

The Executive Summary provides a very general overview of mitigation planning, the planning process, and the steps involved in implementing the Plan.

#### **Section 1: Introduction**

The Introduction describes the background and purpose of developing the Plan for RPV/RHE.

#### **Section 2: Planning Area Profile**

The section presents the history, geography, demographics, and socioeconomics of RPV/RHE. It provides valuable information on the demographics and history of the region.

### **Part II: Hazard Analysis**

This section provides information on the process used to assess the demographics and development patterns for the community along with an assessment of the hazards.

#### **Section 3: Risk Assessment**

This section provides information on hazard identification, vulnerability and risk associated with natural hazards in the planning area.

## Sections 4-8: Hazard-Specific Analysis

Hazard-Specific Analysis on the five hazards posing the greatest threat to the planning area. These hazards occur with some regularity and have been predicted through historic evidence and scientific methods. These hazards include:

- Section 4: Earthquake
- Section 5: Wildfire
- Section 6: Earth Movement
- Section 7: Tsunami

Additionally, the Planning Team opted to include a discussion on technological and human-caused hazards, even though these events pose a lesser threat to the planning area.

Section 8: Technological and Human-Caused

Each Hazard-Specific Analysis includes information on the history, hazard causes, hazard characteristics, and hazard assessment.

## Part III: Mitigation Strategies

### Section 9: Mitigation Strategies

This section highlights the Mitigation Actions Matrix and: 1) past accomplishments; 2) planning approach; 3) goals and objectives; 4) identification, analysis, and implementation of mitigation activities; 5) prioritized mitigation activities; and 6) next steps.

### Section 10: Planning Process

This section describes the mitigation planning process including: 1) Planning Team involvement, 2) extended Planning Team support, 3) public and other stakeholder involvement; and 4) integration of existing data and plans.

### Section 11: Plan Maintenance

This section provides information on Plan implementation, monitoring and evaluation.

## Part IV: Appendix

The Plan appendix is designed to provide users of the Plan with additional information to assist them in understanding the contents of the Plan.

### Appendix A: Benefit/Cost Analysis

This section describes FEMA's requirements for benefit cost analysis in hazards mitigation, as well as various approaches for conducting economic analysis of proposed mitigation activities.

## Plan Mission

The mission of the Plan is to promote sound public policy designed to protect citizens, critical facilities, infrastructure, private property, and the environment from natural, human-caused, and technological hazards. This is achieved by increasing public awareness, documenting the resources for risk reduction and loss-prevention, and identifying activities to help guide the Cities toward building a safer, more sustainable community.

## Mitigation Planning Process

The process for creating the 2014 Plan started with identifying members for the Planning Team. Each team member represented different City departments and specific divisions within those departments with a role in mitigation efforts, the Los Angeles County Fire Department, and the Area G Disaster Management Area Coordinator. The Planning Team met and identified characteristics and consequences of natural and technological and human-caused hazards with significant potential to affect the Cities. The Planning Team utilized the contents from the 2004 Plan to create this 2014 document.

Hazard mitigation strategy and goals were developed by understanding the risk posed by the identified hazards. The group also determined hazard mitigation activities and priorities to include scenarios for both present and future conditions. The final Plan will be implemented through various projects, changes in day-to-day city operations, and through continued hazard mitigation development.

Through a series of Planning Team meetings, Mitigation Action Items identified in the 2004 Plan were reviewed and status information documented.

## Public Input

The Plan will be available to the public through different venues and will engage the public, involve them in ongoing planning and evaluation, and facilitate communication. The Planning Team recognizes that community involvement increases the likelihood that hazard mitigation will become a standard consideration in the evolution of both Cities.

The Planning Team will post a public notice on both City websites during the plan writing phase five years and during the review periods and prior to each of the City Council public meetings. The resources and information cited in the Plan provide a strong local perspective and help identify strategies and activities to make RPV/RHE more disaster resistant.

## Participating Organizations

For mitigation planning to be successful; like all community planning; it requires collaboration with, and support from, federal, state, local, and regional governments; citizens; the private sector; universities; and non-profit organizations. The Planning Team consulted a variety of sources to ensure that the planning process results in practicable actions tailored to local needs and circumstances.

## The Planning Area and Hazard Mitigation

Throughout history, the residents of the planning area have dealt with the various natural hazards affecting the area. The earliest inhabitants of the Palos Verdes Peninsula, the Tongva Indians, were careful to locate their villages on high ground for safety from winter floods (source: Fink: Palos Verdes Peninsula: Time and the Terraced Land, 1987).

Although there were far fewer people in the area prior to 1900, the natural hazards adversely affected the lives of those who depended on the land and climate conditions for food and welfare. For example, the drought of 1862-64 devastated local cattle ranching operations on

the peninsula (source: Fink, 1987). As the population of the area has continued to increase over time, particularly in the last 50 years, the exposure to natural hazards creates an even higher risk than previously experienced.

Although this Plan only analyzes and provides mitigation for RPV/RHE, this section discusses natural disasters that have affected the entire Palos Verdes Peninsula. Because it is a single geographic landform, natural disasters that have occurred in other parts of the Peninsula in the past have a high likelihood to impact the planning area in the future.

The planning area maintains some of the lowest population densities in Los Angeles County, and offers the benefits of living in a Mediterranean type of climate. The area is characterized by the unique and attractive landscape, magnificent views, and a semi-rural/coastal environment that makes the area so popular. However, the potential impacts of natural hazards associated with the terrain make the environment and population vulnerable to natural disaster situations.

The planning area is vulnerable to significant disruption from earthquakes, wildfires, earth movements, and tsunamis. The Planning Team opted to also include a discussion on technological and human-caused hazards, even though they pose a lesser threat to the planning area. It is difficult to predict when these disasters will occur, or the extent to which they will affect the planning area. However, with careful planning and collaboration among public agencies, private sector organizations, and citizens within the community, it is possible to minimize the losses that can result from these natural disasters.

## Mitigation Planning

As the cost of damage from natural disasters continues to increase nationwide, the Cities recognize the importance of identifying effective ways to reduce vulnerability to disasters. Natural hazard mitigation plans assist communities in reducing risk from hazards by identifying resources, information, and strategies for risk reduction, while helping to guide and coordinate mitigation activities throughout the Cities.

The Plan provides a set of action items to reduce risk from natural hazards such as education and outreach programs and the development of partnerships. The Plan also provides for the implementation of preventative activities, including programs that restrict and control development in areas subject to damage from natural hazards.

The resources and information within the Plan:

1. Establish a basis for coordination and collaboration among agencies and the public in RPV/RHE.
2. Identify and prioritize future mitigation projects; and
3. Assist in meeting the requirements of federal assistance programs.

The Plan works in conjunction with other City plans, including Multi-Hazard Functional Plans.

## Mitigation Plan Jurisdiction and Scope

The Plan affects the areas within the planning area boundaries, with emphasis on City owned facilities and land. This Plan provides a framework for planning for natural and technological

and human-caused hazards. The resources and background information in the Plan address existing and future land development throughout RPV/RHE.

## Risk Assessment

Risk assessment is the identification of risks posed by a hazard and the corresponding impacts to the community. This process involves five steps: 1) identify hazards, 2) profile hazards, 3) inventory critical assets, 4) assess risks, and 5) assess vulnerability of future development.

### *Step 1: Identify Hazards*

The Planning Team identified the natural hazards that could significantly impact the planning area by referencing their General Plans and the County of Los Angeles All-Hazard Mitigation Plan (2014).

The Planning Team ranked the hazards based on the probability, magnitude/severity, warning time, and duration.

That analysis yielded the following hazards as posing the greatest risk to the planning area: earthquakes, wildfires, earth movement, and tsunamis.

### *Step 2: Profile Hazards*

Hazard profiles determine the extent to which each hazard could impact the Cities. Each hazard profile contains the following information:

- ✓ Background and local conditions
- ✓ Historic frequency and probability of occurrence
- ✓ Severity
- ✓ Historic losses and impacts
- ✓ Designated hazard areas

Other factors considered include potential impact, onset, frequency, hazard duration, cascading effects, and recovery time for each hazard. Using this information, the Planning Team assessed the relative risk of each hazard ranging from severe risk to no risk. Where applicable, the source(s) of information, data, and maps showing vulnerable areas and relevant community components are provided.

### *Step 3: Inventory Critical Assets*

Once hazards and profiles were established, locations of critical facilities were plotted and analyzed. To estimate losses from each hazard (number of structures, value of structures and number of people), the Planning Team used local resources; Census data; Hazards U.S. - Multi-Hazard (HAZUS-MH), a Geographic Information System (GIS) risk assessment methodology; and other GIS capabilities including local, regional, and state mapping resources.

The inventory of assets shows a range of resources that could be lost or damaged for each hazard such as population, general building stock (residential and commercial), critical facilities (Police / Fire stations and transportation systems), and utilities.

### *Step 4: Assess Risks*

Estimated losses to structures and their contents, as well as the losses to structure use and function, were identified (as data was available).

### *Step 5: Vulnerability Analysis of Future Development*

This step provides a general description of the planning area facilities and contents in relation to the identified hazards so that mitigation options can be considered in land use planning and future land use decisions. This Plan provides a comprehensive description of the character of the planning area in Section 2: Planning Area Profile. This description includes the geography and environment, population and demographics, land use and development, housing and community development, employment and industry, and transportation and commuting patterns. Analyzing these components helps to identify potential problem areas and serves as a guide for incorporating the goals and ideas contained in this Plan into other community development plans.

## Mitigation Goals

The risk assessment and public input involved a review of past mitigation actions, future goals, and appropriate mitigation strategies. The Planning Team identified five mitigation goals that summarize the hazard reduction outcome the Cities want to achieve:

- ✓ Protect Life and Property
- ✓ Enhance Public Awareness
- ✓ Preserve Natural Systems
- ✓ Encourage Partnerships and Implementation
- ✓ Strengthen Emergency Services

These goals guided the development and implementation of specific mitigation activities. Many of the mitigation objectives and action items come from current programs. Emphasis was placed on the effectiveness of the activities with respect to their estimated cost.

## Plan Writing

Preparation of the First Draft Plan resulted from input from the Planning Team and assistance from the consultant. Once the Team had an opportunity to review the First Draft Plan, the document was posted on the City websites and invitations were distributed to outside agencies

### **\* ELEMENT A: PLANNING PROCESS | A3**

A3. Does the Plan document how the public was involved in the planning process during the drafting stage?  
(Requirement §201.6(b)(1))

announcing the availability of the Plan and the opportunity to participate in the drafting of the plan. The remainder of the plan writing phase consisted of posting updated versions of the Plan and incorporation of input gathered from the public and outside agencies into the various drafts.

## Plan Approval

The 2014 Plan was submitted to Cal OES and FEMA for a joint review. FEMA issued a conditional approval on June 13, 2013 pending adoption by both City Councils. On August 6, 2014 FEMA issued a final approval of the 2014 Plan.

## Plan Adoption

The 2004 Joint Natural Hazards Mitigation Plan was originally adopted by the City of Rolling Hills Estates on September 28, 2004 and by the City of Rancho Palos Verdes on October 5, 2004. The 2014 Multijurisdictional Hazard Mitigation Plan is an update to the 2004 Plan. The 2014 Plan was presented to the City of Rancho Palos Verdes City Council for adoption on December 3, 2013 and to the City of Rolling Hills Estates City Council on January 14, 2014. Copies of both City Council resolutions are located in Section 10: Planning Process.

## Point of Contact

To request information or provide comments regarding this Plan, please contact:

## Plan Maintenance

Mitigation planning is an ongoing process involving changes as new hazards occur, as the area develops, and as more is learned about hazards and their impacts. The Planning Team will monitor changing conditions, help implement mitigation activities, review the plan semi-annually to determine if City goals are being met, and provide an update to Cal OES and FEMA every five years. In addition, the Planning Team will review After-Action Reports generated after any disaster that impacts the Cities, and revise the Plan, as needed.

## Section 1: Introduction

---

Throughout history, the residents of the planning area have dealt with the various natural hazards affecting the area. The earliest inhabitants of the Palos Verdes Peninsula, the Tongva Indians, were careful to locate their villages on high ground for safety from winter floods (Source: Fink: Palos Verdes Peninsula: Time and the Terraced Land, 1987).

Although there were far fewer people in the area prior to 1900, the natural hazards adversely affected the lives of those who depended on the land and climate conditions for food and welfare. For example, the drought of 1862-64 devastated local cattle ranching operations on the peninsula (Source: Fink, 1987). As the population of the area has continued to increase over time, particularly in the last 50 years, the exposure to natural hazards creates an even higher risk than previously experienced.

Although this plan only analyzes and provides mitigation for the Cities of RPV/RHE, this section discusses natural disasters that have affected the entire Palos Verdes Peninsula. Because it is a single geographic landform, natural disasters that have occurred in other parts of the Peninsula in the past have a high likelihood to impact the planning area in the future.

The planning area maintains some of the lowest population densities in Los Angeles County, and offers the benefits of living in a Mediterranean type of climate. The area is characterized by the unique and attractive landscape, magnificent views and a semi-rural/coastal environment, that makes the area so popular. However, the potential impacts of natural hazards associated with the terrain make the environment and population vulnerable to natural disaster situations.

The planning area is vulnerable to significant threats from earthquakes, wildfires, earth movements, and tsunamis. It is impossible to predict when these disasters will occur, or the extent to which they will affect the planning area. However, with careful planning and collaboration among public agencies, private sector organizations, and citizens within the community, it is possible to minimize the losses that can result from these natural disasters.

The City of Rancho Palos Verdes has declared a local emergency on only two occasions, both related to earth movement caused by excessive rains during severe weather. On March 8, 1979, the City of Rancho Palos Verdes declared a local emergency due to severe earth movement resulting from heavy and unusual rains. Rancho Palos Verdes again declared a local emergency on January 17, 1995 due to severe El Nino rainstorms that caused flooding and sliding throughout the community. Rolling Hills Estates most recently declared local emergencies in 2005 and 2010 due to severe weather.

### Why Develop a Mitigation Plan?

As the cost of damage from natural disasters continues to increase nationwide, the Cities recognize the importance of identifying effective ways to reduce vulnerability to disasters. Mitigation plans assist communities in reducing risk from hazards by identifying resources, information, and strategies for risk reduction, while helping to guide and coordinate mitigation activities throughout the Cities.

The Plan provides a set of action items to reduce risk from natural hazards such as education and outreach programs and the development of partnerships. The Plan also provides for the

implementation of preventative activities, including programs that restrict and control development in areas subject to damage from natural hazards.

The resources and information within the Plan:

1. Establish a basis for coordination and collaboration among agencies and the public in RPV/RHE.
2. Identify and prioritize future mitigation projects; and
3. Assist in meeting the requirements of federal assistance programs.

The Plan works in conjunction with other City plans, including Multi-Hazard Functional Plans.

## Mitigation Planning Process

The process for creating the 2014 Plan started with identifying members for the Planning Team. Each team member represented different City department and specific divisions within those departments with a role in mitigation efforts, the Los Angeles County Fire Department, and the Area G Disaster Management Area Coordinator. The Planning Team met and identified characteristics and consequences of natural hazards with significant potential to affect the Cities. The Planning Team utilized the contents from the 2004 Plan to create this 2014 document.

Hazard mitigation strategy and goals were developed by understanding the risk posed by the identified hazards. The group also determined hazard mitigation activities and priorities to include scenarios for both present and future conditions. The final Plan will be implemented through various projects, changes in day-to-day City operations, and through continued hazard mitigation development.

Through a series of Planning Team meetings, Mitigation Action Items identified in the 2004 Plan were reviewed and status information documented.

## Summary of Changes

Listed below, by section, are the updates and amendments addressed during the plan update process.

### Executive Summary

To enhance the Executive Summary, in order to provide further clarification for the reader, the Planning Team:

- ✓ Added two Point of Contacts to provide readers with easy access to the individuals, assigned by the Cities, with the responsibility for facilitating the maintenance of the Plan
- ✓ Added an introduction to the Risk Assessment process
- ✓ Added an introduction to Mitigation Strategies
- ✓ Added an introduction to Plan Adoption
- ✓ Added an introduction to Plan Maintenance
- ✓ Included the FEMA date of approval for the 2004 Plan

## Section 1: Introduction

The review and analysis of this section of the Plan identified a need to further expand on the concepts contained within by adding the following topics:

- ✓ Mitigation Planning Process
- ✓ Why Plan for Hazards?
- ✓ Hazard Mitigation Legislation
- ✓ State and Federal Support
- ✓ Hazards U.S. – Multi-Hazard
- ✓ Who Does the Plan Affect?

In addition, the Planning Team updated the Map of Planning Area (Map 1-1).

## Section 2: Planning Area Profile

The Planning Team added descriptive information found in the respective cities General Plans. The Planning Team also confirmed the information contained in this section for accuracy and made the following appropriate amendments:

- ✓ Added data sources used to confirm community profile information
- ✓ Updated Population and Demographics data
  - Updated Table 2-1: Planning Area Demographics
- ✓ Updated Housing and Community Development data
  - Added Table 2-2: Housing in the Planning Area
- ✓ Updated Employment and Industry data
  - Added Table 2-3: Planning Area Industry
  - Added Table 2-4: Planning Area Occupation
- ✓ Updated Transportation and Commuting Patterns data

## Section 3: Risk Assessment

The Planning Team applied the Calculated Priority Risk Index (CPRI) method to the 2014 Plan in an effort to better compare the hazards identified by the Planning Team as posing a “significant” threat to the community. Utilizing the CPRI, the Planning Team re-confirmed that the natural hazards (Earthquake, Wildfire, Earth Movement, and Tsunami), identified in the 2004 Plan were the most significant threats facing the community. After further analysis, the Planning Team decided to add an additional section to the Updated Plan as listed below:

- ✓ Technological and Human-caused Hazards

The 2014 Plan includes an updated discussion of hazard identification and includes an introduction to FEMA’s Calculated Priority Risk Index ranking technique. Additionally, the Planning Team added the following items:

- ✓ Added Table 3-1: Calculated Priority Risk Index
- ✓ Added Table 3-2: Calculated Priority Risk Index for Planning Area

- ✓ Added Table 3-3: Vulnerability: Location, Extent, and Probability for Planning Area for each identified hazard.
- ✓ Updated Table 3-5: Critical Facilities Vulnerable to Hazards
- ✓ Updated Table 3-6: Essential Facilities Vulnerable to Hazards
- ✓ Added Table 3-7 and Table 3-8: Impacts to Existing and Future Types of Structures

#### Section 4: Earthquake Hazards

The Planning Team updated the historical information by adding earthquake events since the 2004 Plan adoption and included new earthquake studies and findings. Additional topics on *Impacts of Earthquakes in the Planning Area, Severity, Measuring and Describing Earthquakes, and Mercalli Intensity Scale* were added to more specifically define what community members can expect from an earthquake event. Also, the Planning Team:

- ✓ Added a graphic depicting the CPRI rating for earthquake hazards
- ✓ Added Table 4-2: Historical Earthquakes near Los Angeles County
- ✓ Added Map 4-1: Planning Area Fault Map
- ✓ Added Seismic Shaking Intensity Maps
- ✓ Added Planning Area specific HAZUS Maps and Reports
- ✓ Added a list of faults within close proximity to the Planning Area
- ✓ Added an Earthquake Probabilities list showing the location and maximum credible events for each of the known earthquake faults in the region

#### Section 5: Wildfire Hazards

The Planning Team added historical information on Southern California fires since the 2004 plan and added more descriptions on “Why Wildfires are a Threat to the Planning Area”. Topics were added on *Impacts of Wildfires in Planning Area, Severity, and Local Conditions* to more specifically define what community members can expect from a wildfire event. In addition, the Planning Team:

- ✓ Added a graphic depicting the CPRI rating for wildfire hazards
- ✓ Updated “Fire Hazard Severity Zone” maps for both cities
- ✓ Added information about 2007 Southern California wildfires
- ✓ Added Table 5-1: 20 Largest California Wildland Fires (By Acreage Burned)
- ✓ Added Table 5-2: 20 Largest California Wildland Fires (By Structures Destroyed)
- ✓ Added Table 5-3: Acreage Burned in Los Angeles County 2004-2010
- ✓ Added Table 5-4: Los Angeles County Wildfire Incidents 2007-2010

#### Section 6: Earth Movement Hazards

The Planning Team added topics on *Impacts of Landslides in the Planning Area, Severity, and Local Conditions* to more specifically define what community members can expect from a landslide event. In addition, the Planning Team:

- ✓ Added a graphic depicting the CPRI rating for landslide hazards

- ✓ Added Map 6-1: Planning Area Landslide Hazard Map
- ✓ Added Handout 6-1: Rancho Palos Verdes Public Information Handout – regarding the instability of the San Ramon Canyon

### **Section 7: Tsunami Hazards**

The Planning Team added topics on *Impact of Tsunamis in the Planning Area, Severity and Local History of Tsunamis* to more specifically define what community members can expect from a tsunami event. In addition, the Planning Team:

- ✓ Added a graphic depicting the CPRI rating for tsunami hazards
- ✓ Updated Table 7-1: Tsunami Events in California 1930-2012
- ✓ Added Tsunami Inundation Maps 7-1 through 7-3

### **Section 8: Technological and Human-caused Hazards**

The Planning Team decided to include this newly created section for educational purposes. Based on the Risk Assessment conducted by the Planning Team, Technological and Human-Caused Hazards were deemed to pose a “low” threat to the Planning Area. The Planning Team included brief discussions of the following hazards:

- ✓ Hazardous Materials Release
- ✓ Civil Disturbance
- ✓ Terrorism
- ✓ Epidemic/Pandemic
- ✓ Energy Shortage
- ✓ Radiological Accidents
- ✓ Transportation Accidents
- ✓ Water Shortage
- ✓ Natural Gas Pipeline Incidents

### **Section 9: Mitigation Strategies**

The Planning Team reviewed and analyzed this section of the plan and subsequently added, updated or made the following changes:

- ✓ Added the following topics:
  - Overview of Mitigation Strategy
  - Planning Approach
  - Mitigation Measure Categories
- ✓ Added the goals, policies, and projects relating to hazard mitigation from the City of RPV/RHE General Plans.
- ✓ Updated the Mitigation Actions Matrix in the following ways:
  - The action items themselves were updated including appropriate coordinating organization, timeline, and plan goals addressed
  - Columns were added for priority ranking (low, medium, and high)

- A column was added for comments pertaining to the status of the action item (New, Revised, Completed, Deleted, and Deferred)
- Extreme care was taken in documenting any changes or other substantive information pertaining to the status of each mitigation action item
- ✓ Reaffirmed the plan goals and definitions from the 2004 Plan

The Planning Team also made considerable revisions to the topic entitled “How are the Mitigation Action Items Organized?” These revisions included new sources of data including priority ranking and status.

### **Section 10: Planning Process**

The Planning Process was previously contained in the 2004 Plan as *Appendix B: The Public Participation Process*. The Planning Team recognized the importance of public participation and opted to bring that content to the core of the 2014 Plan. In addition, the Planning Team:

- ✓ Added Table 10-1: Planning Team Timeline and Table 10-2: Planning Team Level of Participation to better define the effort involved in the planning process
- ✓ Updated the list of meetings that they had been involved in for the 2014 Update
- ✓ Updated the distribution list of the outside agencies that were informed of the availability of the 2014 Plan Update
- ✓ Updated the attachments including:
  - Public notice for the hearings
  - City Council Resolution
  - Planning Team sign-in sheets

### **Section 12: Plan Maintenance**

The Planning Team reviewed the content of this section and agreed to leave the content as written with the following amendments:

- ✓ Updated the composition of the list of Planning Team members
- ✓ Designated the City Managers as having authority to approve updates and amendments to future Mitigation Plans

## **Why Plan for Hazards?**

Hazards impact residents, businesses, property, the environment, and the economy of RPV/RHE. Earthquake, wildfire, earth movement, tsunamis, and technological and human-caused hazards have either occurred in the past or have a high potential to expose planning area residents and businesses to the financial and emotional costs of recovering after disasters. The risk associated with hazards increases as more people move to areas affected by these hazards.

Even in those communities that are essentially “built-out” (i.e., have little or no vacant land remaining for development), population density continues to increase when existing lower

density residential and non-residential development is replaced with medium and high density residential development projects.

The inevitability of hazards, and the growing population and activity within the area create an urgent need to develop strategies, coordinate resources, and increase public awareness to reduce risk and prevent loss from future hazard events. Identifying the risks posed by hazards, and developing strategies to reduce the impact of a hazard event can assist in protecting life and property of citizens and communities. Local residents and businesses can work together with the Cities to create a mitigation plan that addresses the potential impacts of hazardous events.

## Hazard Mitigation Legislation

Relevant hazard mitigation legislation and grants are highlighted below.

### *Hazard Mitigation Grant Program*

In 1974, Congress enacted the Robert T. Stafford Disaster Relief and Emergency Act, commonly referred to as the Stafford Act. In 1988, Congress established the Hazard Mitigation Grant Program (HMGP) via Section 404 of the Stafford Act. Regulations regarding HMGP implementation based on the DMA 2000 were initially changed by an Interim Final Rule (44 CFR Part 206, Subpart N) published in the Federal Register on February 26, 2002. A second Interim Final Rule was issued on October 1, 2002.

The HMGP helps states and local governments implement long-term hazard mitigation measures for natural hazards by providing federal funding following a federal disaster declaration. Eligible applicants include state and local agencies, Indian tribes or other tribal organizations, and certain nonprofit organizations.

In California, the HMGP is administered by Cal OES. Examples of typical HMGP projects include:

- ✓ Property acquisition and building relocation
- ✓ Structural retrofitting to minimize damages from earthquake, flood, high wind, wildfire, or other natural hazards
- ✓ Elevation of flood-prone structures
- ✓ Vegetative management programs, such as:
  - Brush control and maintenance
  - Fuel break lines in shrubbery
  - Fire-resistant vegetation in potential wildland fire areas

### *Pre-Disaster Mitigation Program*

The Pre-Disaster Mitigation Program (PDM) was authorized by §203 of the Stafford Act, 42 United States Code (USC), as amended by §102 of the DMA 2000. Funding is provided through the National Pre-Disaster Mitigation Fund to help state and local governments (including Indian tribal governments) implement cost-effective hazard mitigation activities that complement a comprehensive mitigation program.

In Fiscal Year 2011, two types of grants (planning and competitive) were offered under the PDM Program. Planning grants allocate funds to each state for mitigation plan development. Competitive grants distribute funds to states, local governments, and federally recognized Indian tribal governments via a competitive application process. FEMA reviews and ranks the submittals based on pre-determined criteria. The minimum eligibility requirements for competitive grants include participation in good standing in the National Flood Insurance Program (NFIP) and a FEMA-approved Mitigation Plan. (Source: <http://www.fema.gov/fima/pdm.shtm>)

### *Flood Mitigation Assistance Program*

The Flood Mitigation Assistance (FMA) Program was created as part of the National Flood Insurance Reform Act (NFIRA) of 1994 (42 U.S.C. 4101). Financial support is provided through the National Flood Insurance Fund to help states and communities implement measures to reduce or eliminate the long-term risk of flood damage to buildings, manufactured homes, and other structures insurable under the NFIP.

Three types of grants are available under FMA: planning, project, and technical assistance. Planning grants are available to states and communities to prepare flood mitigation plans. NFIP-participating communities with approved flood mitigation plans can apply for project grants to implement measures to reduce flood losses. Technical assistance grants in the amount of 10 percent of the project grant are available to the state for program administration. Communities that receive planning and/or project grants must participate in the NFIP. Examples of eligible projects include elevation, acquisition, and relocation of NFIP-insured structures. (Source: <http://www.fema.gov/fima/fma.shtm>)

### *Disaster Mitigation Act of 2000*

DMA 2000 (DMA 2000) was signed by President Clinton on October 30, 2000 (Public Law 106-390). Section 322 primarily deals with the development of mitigation plans. The Interim Final Rule for planning provisions (44 CFR Part 201) was published in the Federal Register twice: February 26, 2002 and October 1, 2002. The mitigation planning requirements are implemented via 44 CFR Part 201.6.

DMA 2000 was designed to establish a national program for pre-disaster mitigation, streamline disaster relief at the federal and state levels, and control federal disaster assistance costs. Congress believed these requirements would produce the following benefits:

- ✓ Reduce loss of life and property, human suffering, economic disruption, and disaster costs.
- ✓ Prioritize hazard mitigation at the local level with increased emphasis on planning and public involvement, assessing risks, implementing loss reduction measures, and ensuring critical facilities/services survive a disaster.
- ✓ Promote education and economic incentives to form community-based partnerships and leverage non-federal resources to commit to and implement long-term hazard mitigation activities.

Under DMA 2000 state and local government (each city, county, and special district), and tribal government must develop a Mitigation Plan to be eligible to receive HMGP funds. Every mitigation plan, which must be reviewed by the state and approved by FEMA, should address the following items:

- ✓ Plan Promulgation
- ✓ Planning Process including Public Involvement
- ✓ Hazard Identification and Risk Assessment
- ✓ Mitigation Strategy
- ✓ Plan Implementation and Maintenance Procedures

## State and Federal Support

While local jurisdictions have primary responsibility for developing and implementing hazard mitigation strategies, they are not alone. Various state and federal partners and resources can help local agencies with mitigation planning.

Cal OES is the lead agency for mitigation planning support to local governments. In addition, FEMA offers grants, tools, and training.

The Plan was prepared in accordance with the following regulations and guidance:

- ✓ DMA 2000 (Public Law 106-390, October 10, 2000)
- ✓ 44 CFR Parts 201 and 206, Mitigation Planning and Hazard Mitigation Grant Program, Interim Final Rule, October 1, 2002
- ✓ 44 CFR Parts 201 and 206, Mitigation Planning and Hazard Mitigation Grant Program, Interim Final Rule, February 26, 2002
- ✓ How-To Guide for Using HAZUS-MH for Risk Assessment, (FEMA 433), February 2004
- ✓ Mitigation Planning “How-to” Series (FEMA 386-1 through 9 available at: <http://www.fema.gov/fima/planhowto.shtm>)
- ✓ Getting Started: Building Support For Mitigation Planning (FEMA 386-1)
- ✓ Understanding Your Risks: Identifying Hazards and Estimating Losses (FEMA 386-2)
- ✓ Developing the Mitigation Plan: Identifying Mitigation Actions and Implementing Strategies (FEMA 386-3)
- ✓ Bringing the Plan to Life: Implementing the Mitigation Plan (FEMA 386-4)
- ✓ Using Benefit-Cost Review in Mitigation Planning (FEMA 386-5)
- ✓ Integrating Historic Property and Cultural Resource Considerations into Mitigation Planning (FEMA 386-6)
- ✓ Integrating Manmade Hazards Into Mitigation Planning (FEMA 386-7)
- ✓ Multi-Jurisdictional Mitigation Planning (FEMA 386-8)
- ✓ Using the Mitigation Plan to Prepare Successful Mitigation Projects (FEMA 386-9)
- ✓ State and Local Plan Interim Criteria Under the DMA 2000, July 11, 2002, FEMA
- ✓ Mitigation Planning Workshop For Local Governments-Instructor Guide, July 2002, FEMA
- ✓ Report on Costs and Benefits of Natural Hazard Mitigation, Document #294, FEMA

- ✓ LHMP Development Guide – Appendix A - Resource, Document, and Tool List for Local Mitigation Planning, December 2, 2003, Cal OES

## Hazards U.S. – Multi-Hazard

In 1997, FEMA developed a standardized model for estimating losses caused by an earthquake. Hazards U.S. (HAZUS) addressed the need for more effective national, state, and local planning and the need to identify areas that face the highest risk and potential for loss.

|   |  |
|---|--|
| <p>HAZUS-MH uses Geographic Information System technology to produce detailed maps and analytical reports on physical damage to building stock, critical facilities, transportation systems, and utilities.</p> | <p>Hazards U.S. Multi-Hazard (HAZUS-MH) provides models to estimate potential losses from floods (coastal and riverine) and winds (hail, hurricane, tornado, tropical cyclone, and thunderstorm). HAZUS-MH applies engineering and scientific risk calculations developed by hazard and information technology experts to provide defensible damage and loss estimates. This methodology provides a consistent framework for assessing risk across a variety of hazards.</p> <p>HAZUS-MH uses Geographic Information System technology to produce detailed maps and analytical reports on physical damage to building stock, critical facilities, transportation systems, and utilities. The damage reports cover induced damage (debris, fire, hazardous material, and inundation) and direct economic and social losses (casualties, shelter requirements, and economic impacts), promoting standardization.</p> |
|---|--|

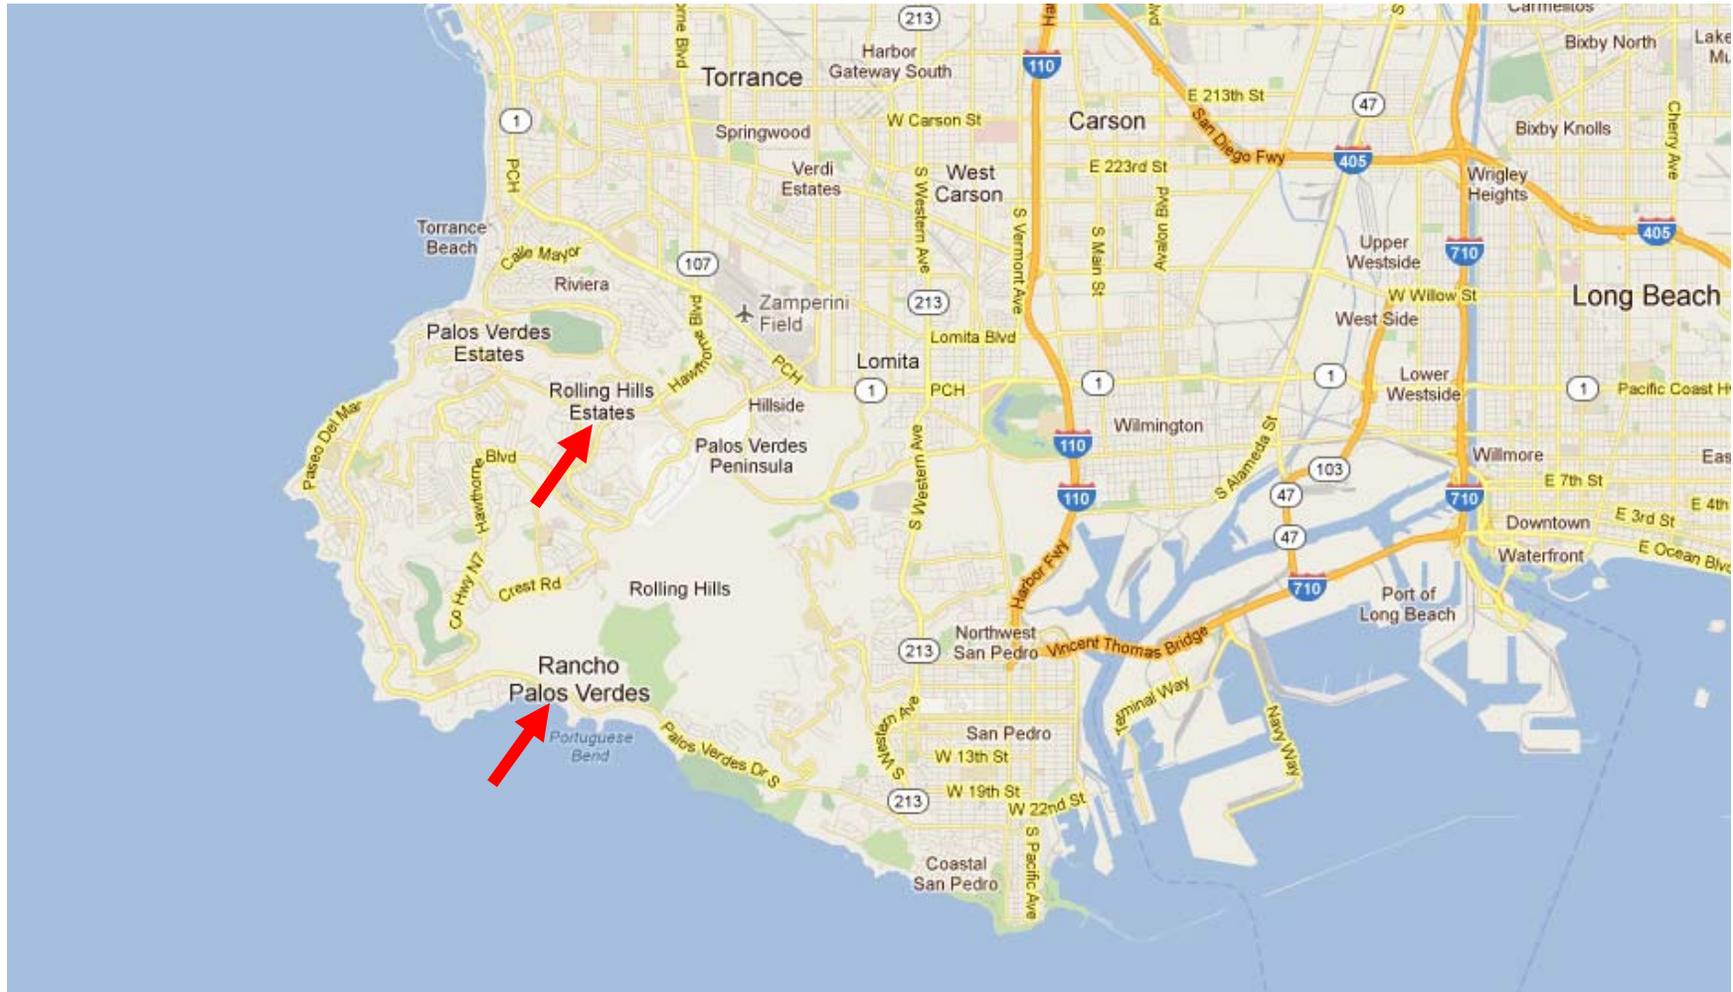

HAZUS maps and reports in the 2014 Plan created by Emergency Planning Consultants and the County of Los Angeles are included in the Hazard-Specific Sections.

## Who Does the Plan Affect?

The Plan affects the entire planning area. This Plan provides a framework for planning for hazards. The resources and background information in the plan is applicable area-wide, and the goals and recommendations can lay groundwork for other local mitigation plans and partnerships. Map 1-1 shows the regional proximity of RPV/RHE to their adjoining communities.

Map 1-1: Map of Planning Area – RPV/RHE  
(Source: Google Maps)

## Section 2: Planning Area Profile

---

### Geography and the Environment

The planning area is located on the Palos Verdes Peninsula, approximately 20 miles south of Central Los Angeles. The total size of the planning area is 17.78 square miles. The City of Rancho Palos Verdes has an area of 13.6 square miles, while the City of Rolling Hills Estates has a smaller area of 4.18 square miles.

The Palos Verdes Peninsula has a unique physiography, formed over millions of years of submerging and lifting from the Pacific Ocean. Once an island, the Peninsula is nine miles wide by four miles deep, now rises above the Los Angeles Basin, with the highest elevation at 1480 feet. The terrain of much of the planning area is rolling hills, steep slopes, canyons and coastal bluffs.

The planning area is bounded on the north by Torrance, Rolling Hills, and Palos Verdes Estates; on the south and west by the Pacific Ocean; and on the east by Lomita and San Pedro (Los Angeles).

### History

The earliest human inhabitants of the Palos Verdes Peninsula were the tribes of Tongva Indians who were first described by the Spanish explorer Cabrillo in 1542. The area was taken under Spanish rule by the armies under Cortez and remained so, virtually undisturbed, until Mexico won its independence from Spain in 1822. In 1827, the Governor of Mexican California rewarded Don Jose Dolores Sepulveda for his military service by giving him a land grant of the “Rancho de los Palos Verdes (Ranch of the Green Trees).” The Sepulveda family operating a flourishing cattle ranch on the land until the great drought of 1862-64 decimated the herds and boundary litigation resulted in the great rancho being awarded to Jotham Bixby in 1882.

In addition to improving the cattle herds, Bixby’s ranch manager, Harry Phillips introduced farming to the Palos Verdes Peninsula in the early 1900’s. He leased land to Japanese farmers on the south slope of the Peninsula to cultivate vegetables, while Caucasian families principally grew grains on the drier northern slopes. In 1913, a group of New York investors purchased most of the peninsula intending to develop a community of large estates for the wealthy. It was not until 1921, however, that Frank A. Vanderlip, Sr., one of the New York investors, and E.G. Lewis, a real estate promoter, founded the Palos Verdes Project and the first houses first appeared on the hillsides in 1924.

Although the rate of development was slow through the decades of the Great Depression and World War II, the economic and population boom that occurred in the post-war years precipitated the most rapid period of growth on the Palos Verdes Peninsula during the 1950’s and 1960’s. The pace of development has been much slower over the last three decades, with the majority of the remaining open tracts of land either being developed for low-density residential projects or preserved as permanent open space. (Source: Palos Verdes Peninsula: Time and the Terraced Land by Augusta Fink, Western Tanager Press, 1987) Rolling Hills Estates was incorporated in 1957 in order to preserve and protect a rural community atmosphere. Rancho Palos Verdes was incorporated in 1973 in order to gain control over the increasing number of high-density residential projects being approved by the County and to return to predominately single-family residential development pattern in the community.

## Climate

The planning area has one of the most ideal climates of the world. Its average maximum and minimum temperatures range approximately between 67-68°F. and 50-54°F. and the average annual precipitation is approximately 13 inches.

The sea breeze, which is the predominant wind, is a primary factor in creating this climate and typically flows from the west-southwest in a day-night cycle with speeds generally ranging from 5 to 15 mph. The sea breeze maintains the cool temperatures and clean air circulation and generally prevents warmer inland temperatures and air pollution from permeating into the peninsula, except under certain seasonal conditions such as the offshore Santa Ana winds.

## Minerals and Soils

The characteristics of the geology and soils present in the planning area indicate that potential types of hazards that may occur. Due to the Palos Verdes Peninsula's rugged topography, the weak layers exist within the folded sedimentary rock that chiefly underlies the area, and fact that the peninsula is bounded by two sub parallel earthquake faults, the planning area is prone to geologic hazards, such as landslides, earthquakes and liquefaction.

The oldest rocks on the peninsula date to the Jurassic period, a geologic age some 150 million years ago. These rocks are Catalina schist, a metamorphic rock created under great heat and pressure, which form the "basement rock" layer on which all of the peninsula's sedimentary rocks are overlain. During the Miocene period, geologists estimate that the Palos Verdes Peninsula was above and below sea waters a total of three times. While the Palos Verdes Peninsula was under water, sedimentary layers were deposited on the sea floor from the erosion of the higher mountains surrounding en the Los Angeles Basin. The last emergence of the peninsula started 30,000 years ago and occurred in intervals, perhaps 1,000 years apart. Each uplift exposed more land, with a new shoreline being exposed to erosion by ocean waves. A total of thirteen such eroded terraces have been documented, although only five are clearly discernible today. Sediments on the Palos Verdes Peninsula are mostly Monterey Shale, a crumbly brown rock locally designated as Altamira Shale, Valmonte Diatomite and Malaga Mudstone (from oldest to youngest). (Source: Handbook of Wildflowers, Weeds, Wildlife and Weather of the South Bay and Palos Verdes Peninsula by Donald Moore Gales, Foldaroll Company, 1988)

Areas within Rancho Palos Verdes also have intrusions of basalt from volcanic activity sending lava through the sedimentary layers to the surface, where it hardened. Some inland areas contain layers of tuff, which is volcanic ash that has turned into rock. Other earth materials on the peninsula include sandstone shales between limestone layers, the latter creating the beautiful white Palos Verdes stone often used locally as landscaping accents and decorative masonry. In addition to Palos Verdes stone, from the late 1940's to the late 1950's, several types of minerals were extracted at various locations within the planning area through commercial quarrying operations, including sand, basalt, and diatomaceous earth. Due to high land values favoring residential development, there are no current commercial mining operations within the planning area. (Source: Gales, 1988)

The top layer of earth in most ungraded areas is heavy, black adobe clay resulting from weathering of rock debris and other materials. In graded areas, imported topsoil has generally

been added over the exposed sterile diatomite and Altamira shale subsoils to support ornamental landscaping associated with development. (Source: Gales, 1988)

## Population and Demographics

The planning area has a total population of about 49,710 (RPV 41,643 and RHE 8,067). The planning area includes an area of approximately 17.78 square miles (RPV 13.6 square miles and RHE 4.18 square miles). The population of the planning area has increased by 1.8% (adding 889 residents) since the 2000 U.S. Census. (Source: 2000/2010 U.S. Census)

According to the City’s General Plan, Rolling Hills Estates is almost fully urbanized with lower density residential neighborhoods and scattered concentrations of commercial land uses. Vacant parcels are mostly steep slope areas and canyons. A network of equestrian trails and other equestrian facilities provide a major recreational resource for residents. Growth in the City has been very slow, with the limited increase in single-family dwelling units accompanied by a decrease in household sizes.

The Rancho Palos Verdes General Plan states that the City is almost entirely built-out with predominately single-family residential development with scattered concentrations of multi-family residential and commercial development. The remaining vacant parcels are mostly steep slopes, canyons and areas impacted by land movement. Several active park sites and an extensive amount of preserved natural open space and passive parkland, particularly along the City’s coastline, provide the majority of recreational resources for residents. Since the City’s incorporation, growth has proceeded at a slow pace.

The semi-rural character of the planning area creates more community exposure, and changes how agencies prepare for and respond to natural hazards. For example, more people living on the urban fringe face an increased risk of fire hazard. Wildfire has an increased chance of starting due to human activities in the urban/rural interface, and has the potential to injure more people and cause more property damage. But an urban/wildland fire is not the only exposure to the planning area.

According to the 2010 Census figures, the demographic makeup of the Cities is as follows:

**Table 2-1: Planning Area Demographics**  
(Source: 2010 U.S. Census)

| Racial/Ethnic Group | Rancho Palos Verdes<br>(Population %) | Rolling Hills Estates<br>(Population %) |
|---------------------|---------------------------------------|---|
| White Non-Hispanic  | 61.7 %                                | 67.7%                                   |
| Hispanic            | 8.5%                                  | 6.2%                                    |
| Asian               | 29.0%                                 | 24.9%                                   |
| African American    | 2.4%                                  | 1.4%                                    |
| Native American     | 0.2%                                  | 0.2%                                    |
| Other               | 1.9%                                  | 1.6%                                    |

The 2010 Census showed that of the population over 5 years old that speaks English less than “very well” is 33.4% in RPV and 10.6% in RHE. This factor, in combination with an unknown

portion of the planning area’s daytime populations that may not be proficient in the English language, poses a challenge in planning for and mitigating disasters. The ethnic and cultural diversity suggests a need to address multi-cultural needs and services.

Although the Cities do not have data on the number of disabled residents living in the planning area, the 2010 Census indicated that the population over 65 years in age is 23.2% in RPV and 23.1% in RHE, which is higher than the state’s average of 11.4%

The percentage of poverty in RPV is 3.8% and RHE is 1.7%, both are considerably less than the state’s average of 15.8%.

Vulnerable populations, including seniors, disabled citizens, women, and children, as well as those people living in poverty, may be disproportionately impacted by hazards.

Examining the reach of hazard mitigation policies to special needs populations may assist in increasing access to services and programs. FEMA's Office of Equal Rights addresses this need by suggesting that agencies and organizations planning for natural disasters identify special needs populations, make recovery centers more accessible, and review practices and procedures to remedy any discrimination in relief application or assistance.

The cost of hazard recovery can place an unequal financial responsibility on the general population when only a small proportion may benefit from governmental funds used to rebuild private structures. Discussions about hazards that include local citizen groups, insurance companies, and other public and private sector organizations can help ensure that all members of the population are a part of the decision-making processes.

## Housing and Community Development\*

Following is a distribution of the development and housing types in the planning area.

Since the adoption of the previously-approved plan, some development in the Cities of Rancho Palos Verdes and Rolling Hills Estates has occurred due to an upturn in the local economy.

### Development in the City of Rancho Palos Verdes

The City of Rancho Palos Verdes lists on its website (<http://www.palosverdes.com/rpv/planning/planning-zoning/index.cfm>) major development projects in various stages. These are identified below.

---

#### \* ELEMENT D. MITIGATION STRATEGY | D1

D1. Was the plan revised to reflect changes in development? (Requirement §201.6(d)(3))

### ***Major Development Projects Under Operation***

- Mirandela, a 34-unit Senior Affordable Housing project, is located at the northwest corner of Crestridge Road and Crenshaw Boulevard.
- Terranea Resort and Spa, which opened in June 2009, has hotel room accommodations, banquet and conference facilities, restaurants, spa and fitness center, and a 9-hole golf course. Additional public amenities include two free public parking lots, public trails overlooks, a sandy beach, public snack shop, public restrooms, drinking fountains, interpretive signs along the public trails, bicycle racks, picnic tables, benches, and viewing stations.
- The Trump National Golf Club development consists of an 18-hole public golf course, a driving range, a clubhouse, a maintenance facility, 4 affordable housing units, 59 single family residential lots, public parklands, pedestrian and bicycle trails, and native habitat preserves.

### ***Major Development Projects Under Construction***

- Oceanfront Estates Residential Tract is a 79-home single-family subdivision located on the seaward side of Palos Verdes Drive West at the southerly terminus of Hawthorne Boulevard. The 132-acre site is bordered by the Lunada Pointe neighborhood to the north and the City's Point Vicente Interpretive Center to the south. When completed, Oceanfront will include 79 single-family homes on 20,000 to 30,000 square foot lots. A total of 71 acres of the site has been dedicated to the City as open space, including at least 30 acres of coastal sage scrub habitat. The project provides a loop road along the bluff, a 25-space parking lot and pedestrian and bicycle trails.
- The St. John Fisher property is located at 5448 Crest Road, on the southeast corner of the intersection at Crest Road and Crenshaw Boulevard. The property is currently developed with an elementary school (K-8), administrative/parish offices, recreational hall (Barrett Hall), rectory (priest's residence), convent (no longer in use) and sanctuary. The approved project includes a major remodel and expansion of the existing facilities, as well as new construction such as a sanctuary, administration building, additional classrooms, library, storage, garage, and additional offices.

### ***Proposed Major Development Projects***

- The Civic Center Master Plan includes the development of a fully-functioning civic center with a village green, city hall with council chambers, community center, cultural center, parking lot, and trailheads at the Upper Point Vicente Park.
- The Crestridge Senior Housing/Senior Center project would involve the development of a senior-restricted (55+ years of age or older) for-sale residential community with supportive service program. The proposed project would include 60 attached residential units at an overall density of 6.15 units per acre.
- Marymount College Facilities Expansion Project includes residence halls, athletic facility, library, maintenance building, art studio, faculty/academic building, bookstore/faculty dining addition, admission office addition, parking lot reconfiguration/reconstruction, relocation of athletic fields, and demolition.
- Point View Agriculture, Golf Course, and Event Garden Master Plan project includes orchards for avocados, citrus, and vineyards; a 9-hole executive golf course, and an event garden.
- Zone 2 Landslide Moratorium Ordinance Revisions created a new exception category in the City's Landslide Moratorium Ordinance to allow development of undeveloped lots in Zone 2 of the City's Landslide Moratorium Area, in response to the California State Court of Appeal's decisions in the case of Monks v. Ranchos Palos Verdes that prohibition of

development in Zone 2 was a taking and an impermissible impediment to development of the plaintiffs' lots. With this resulting decision, there is potential for the development of 47 lots in this area that is susceptible to landslides.

### ***Approved Major Development Projects That Have Not Begun Construction***

- Highridge Condominiums project includes the development of a 28-unit residential condominium complex with 67 off-street parking spaces.
- Nantasket Drive Residential project includes four residential lots for single-family residential development.

Other planning projects/topics in the City of Rancho Palos Verdes include:

- Abalone Cove Shoreline Park Improvement Project
- California Coastal Trail RPV Segment
- Evaluation of the Portuguese Bend Landslide and Moratorium Ordinance in which the City Geologist has opined that the City should continue to prohibit construction on vacant lots within the entire landslide moratorium area and establish a cumulative maximum of 1,200 square feet of additions to existing homes in the landslide moratorium area.
- Palos Verdes Nature Reserve
- Forrestal Nature Preserve
- Trails Master Plan
- Western Avenue Vision Plan

In addition, the City is undergoing a General Plan Update, including an update to its Housing Element which will likely include anticipated housing development to address Regional Housing Needs. Additionally, the General Plan Update includes a review of "Hazard" areas. The Planning Commission has agreed to move forward with adjusting the Hazard boundary lines as recommended by the City Geologist for only those properties where the Hazard land use area decreases and change the zoning designation for hillside areas to "Open-Space Hillside."

As evidenced above, the City continues to experience development pressures within its boundaries. All the development described above, as well as any in the near future, will continue to increase the City's vulnerability to potential hazards, including earthquake, wildfire, earth movement, and tsunami. Building codes, site and development review requirements, and other mechanisms are in place to address potential hazards and their effect on the built environment. However, additional mitigation-oriented activities and efforts can make the City more resilient to the impacts of the identified hazards.

### **Development in the City of Rolling Hills Estates**

Projects in the City of Rolling Hills Estates that are completed, planned, or proposed, based on the City's website (<http://www.ci.rolling-hills-estates.ca.us/index.aspx?page=129>), are identified below.

- The proposed 655-683 Deep Valley Drive and 924-950 Indian Peak Road Mixed-Use Residential Project is located in the southwestern portion of the City within the City's main commercial area. The proposed project would demolish the existing office buildings at 655 Deep Valley Drive, 924 and 950 Indian Peak Road, surface parking lots, and landscaping. Construction of the proposed project would stabilize the existing landslide and include 148 residential units, approximately 14,200 square feet (sf) of commercial area fronting Deep Valley Drive, and associated parking. In addition, the project would remove 2,013 square feet of commercial space and add 63 off-street

parking spaces, for a total of 137 parking spaces at the Brick Walk commercial development.

- The Chandler Ranch Subdivision/Rolling Hills Country Club project includes 114 new single family homes, a reconfigured 18-hole golf course, and a new approximately 61,000 square foot clubhouse and related facilities. The 228-acre project site is located on the existing sites of the Chandler Quarry and Rolling Hills Country Club (26311 and 27000 Palos Verdes Drive East) in the northeasterly portion of the City of Rolling Hills Estates.
- The proposed project consists of building a new one-story 4,404 square foot freestanding Chase Bank branch with a drive-thru ATM and 31 stalls, at 828 Silver Spur Road.
- The Palos Verdes Drive Bike Lane Project includes the creation of 1.3 miles of bike lanes along Palos Verdes Drive North between Crenshaw Boulevard and the West City Limits. As well as providing five-foot (5') wide on-street striped bike lanes in both directions along this stretch of Palos Verdes Drive North, the project also includes intersection enhancements at Palos Verdes Drive North and Silver Spur Road, Palos Verdes Drive North at Hawthorne Boulevard and Palos Verdes Drive North at Crenshaw Boulevard; new merge lanes to improve traffic safety and reduce traffic congestion; a complete street resurfacing to address the current structural conditions of the roadway; the addition of rolled curbs to improve drainage and keep traffic from the unimproved shoulder; raised median islands to promote traffic calming; and new crosswalk warning systems for school children and equestrians.

Along with existing development, these projects in Rolling Hills Estates will increase the City’s vulnerability to earthquake and wildfire hazards. Although not necessarily located in areas susceptible to earth movement hazards, these projects are located in proximity to highly susceptible hazard areas and can be severely impacted during a disaster event. Additionally, future development may be planned for areas located in identified high hazards areas. Building codes and site and development review processes are in place to address potential hazards and their effect on the built environment. Additional mitigation-oriented activities and efforts can make the City more resilient to the impacts of the identified hazards.

**Table 2-2: Housing in the Planning Area**  
(Source: 2010 Census)

|                               | RPV    | RHE   |
|-------------------------------|--------|-------|
| <b>Housing Type:</b>          |        |       |
| Single-Family                 | 78.6%  | 74.9% |
| Multi-Residential (20+ units) | 9.5%   | 0.8%  |
| Mobile homes                  | 0.1%   | 1.2%  |
| <b>Housing Statistics:</b>    |        |       |
| Total Available Housing Units | 16,003 | 2,950 |
| Owner-Occupied Housing        | 83.0%  | 91.0% |
| Average Household Size        | 2.72   | 2.78  |

## Employment and Industry

The following table indicates the employment and industry statistics for the planning area.

**Table 2-3: Planning Area Industry**  
(Source: 2010 Census)

| Industry   | RPV    |           | RHE    |           |
|--|--------|-----------|--------|-----------|
|  | Number | Percent % | Number | Percent % |
| Civilian employed Population (16 and over)   | 17,588 | 100.0     | 3,404  | 100.0     |
| Agriculture, forestry, fishing and hunting, and mining                                     | 0      | 0.0       | 11     | 0.3       |
| Construction   | 356    | 2.0       | 206    | 6.1       |
| Manufacturing  | 3,145  | 17.9      | 461    | 13.5      |
| Wholesale Trade  | 1,263  | 7.2       | 128    | 3.8       |
| Retail Trade   | 1,506  | 8.6       | 244    | 7.2       |
| Transportation and Warehousing, and Utilities  | 1,234  | 7.0       | 151    | 4.4       |
| Information  | 355    | 2.0       | 50     | 1.5       |
| Finance and insurance, and real estate and rental and leasing                              | 1,200  | 6.8       | 429    | 12.6      |
| Professional, scientific, and management, and administrative and waste management services | 2,524  | 14.4      | 604    | 17.7      |
| Educational services, and health care and social assistance                                | 3,853  | 21.9      | 764    | 22.4      |
| Arts, entertainment, and recreation, and accommodation and food services                   | 660    | 3.8       | 135    | 4.0       |
| Other services, except public administration   | 771    | 4.4       | 103    | 3.0       |
| Public administration  | 721    | 4.1       | 118    | 3.5       |

**Table 2-4: Planning Area Occupation**  
(Source: 2010 Census)

| Occupation   | RPV    |           | RHE    |           |
|--|--------|-----------|--------|-----------|
|  | Number | Percent % | Number | Percent % |
| Civilian employed population (16 years and over)             | 17,588 | 100.00    | 3,404  | 100.0     |
| Management, business, science, and arts occupations          | 11,161 | 63.5      | 2,200  | 64.6      |
| Service occupations  | 1,156  | 6.6       | 197    | 5.8       |
| Sales and office occupations                                 | 3,984  | 22.7      | 804    | 23.6      |
| Natural resources, construction, and maintenance occupations | 374    | 2.1       | 133    | 3.9       |

| Occupation  | RPV    |           | RHE    |           |
|---|--------|-----------|--------|-----------|
|   | Number | Percent % | Number | Percent % |
| Production, transportation, and material moving occupations | 913    | 5.2       | 70     | 2.1       |

Mitigation activities are needed at the business level to ensure the safety and welfare of workers and limit damage to industrial infrastructure. Employees are highly mobile, commuting from surrounding areas to industrial and business centers. This creates a greater dependency on roads, communications, accessibility, and emergency plans to reunite people with their families. Before a hazardous event, large and small businesses can develop strategies to prepare for hazards, respond efficiently, and prevent loss of life and property.

## Transportation and Commuting Patterns

Private automobiles are the dominant means of transportation in Southern California and even more so in the planning area. However, the Peninsula does support MTA Lines 225, 226 and 444 as its means of public transportation. MTA (Metropolitan Transportation Authority) provides both Cities with bus services to various points in the Los Angeles County metropolitan area. In addition to the MTA, the Peninsula Verdes Peninsula Transit Authority (PVPTA) provides six fixed bus routes throughout the Peninsula, which operate primarily on school days and connect with the MTA lines. The PVPTA also provides a dial-a-ride service for seniors and disabled citizens.

The planning area’s road system consists primarily of residential streets serving the various single-family neighborhoods. For example, in Rancho Palos Verdes there are 103.38 centerline miles of residential street, 2.97 miles of collector streets, and 36.47 centerline miles of arterial roadways. There are no bridges in the planning area. The mean travel time to work for the residents of both cities is around 33.1 minutes.

Major external routes serving the planning area include the Harbor Freeway, San Diego Freeway, and Pacific Coast Highway to the north. According to the Rancho Palos Verdes General Plan, the major arterials (provides connections with other arterials and may eventually link-up with major highways) are Hawthorne Boulevard, Western Avenue, Palos Verdes Drive West, and Palos Verdes Drive South. According to the Rolling Hills Estates General Plan, the major arterials are Crenshaw Boulevard, Hawthorne Boulevard, and Palos Verdes Drive North. The planning area is served by the 110 and 405 freeways, which connect the Cities to adjoining parts of Los Angeles County.

## Part II: HAZARD ANALYSIS

---

### Section 3: Risk Assessment

---

#### What is a Risk Assessment?

Conducting a risk assessment can provide information regarding: the location of hazards; the value of existing land and property in hazard locations; and an analysis of risk to life, property, and the environment that may result from hazardous events. Specifically, the five levels of a risk assessment are as follows:

1. *Hazard Identification*
2. *Profiling Hazard Events*
3. *Vulnerability Assessment/Inventory of Existing Assets*
4. *Risk Analysis*
5. *Assessing Vulnerability/Analyzing Development Trends*

#### 1) *Hazard Identification*

This section is the description of the geographic extent, potential intensity, and the probability of occurrence of a given hazard. Maps are used in this plan to display hazard identification data. The Cities identified a wide range of natural, human-caused, and technological hazards based on the State of California Multi-Hazard Mitigation Plan, County of Los Angeles All-Hazard Mitigation Plan, the Cities' General Plans, and the Cities' Emergency Operations Plans to identify all possible hazard sources. These hazards included: earthquake, flood, wildfire, landslide, windstorm, dam failure, tsunami, seiche, terrorism, public health emergency, infestation, drought, climate change, civil disobedience, transportation emergency, power failure, and agricultural loss. The Planning Team identified five hazards posing the greatest threat to the planning area. These hazards – earthquakes, wildfires, earth movement, and tsunami, – were identified through an extensive process involving research of existing documents and input from the Planning Team. It's important to note that “flooding” was eliminated as a primary or significant hazard although the “secondary impacts” of flooding are identified in the Wildfire and Earth Movement Hazard-Specific Sections.

For the sake of public education, the Planning Team opted to also include a discussion on Technological and Human-Caused Hazards, although those scenarios pose a less significant threat to the planning area. The geographic extent of each of the identified hazards has been identified by the Team utilizing the maps and data contained in the General Plans and MHFP Threat Assessments. Utilizing FEMA's Calculated Priority Risk Index (CPRI) ranking technique, the Planning Team concluded that all of the identified hazards posed a significant threat against the planning area. The hazard ranking system is described in Table 3-1: Calculated Priority Risk Index, while the actual ranking is shown in Table 3-2: Calculated Priority Risk Index Ranking for Planning Area.

### *Repetitive Loss Properties\**

According to FEMA documentation, the planning area does not include any repetitive loss properties.

---

**\* ELEMENT B: HAZARD IDENTIFICATION AND RISK ASSESSMENT | B4**

B4. Does the Plan address NFIP insured structures within the jurisdiction that have been repetitively damaged by floods? (Requirement §201.6(c)(2)(ii))

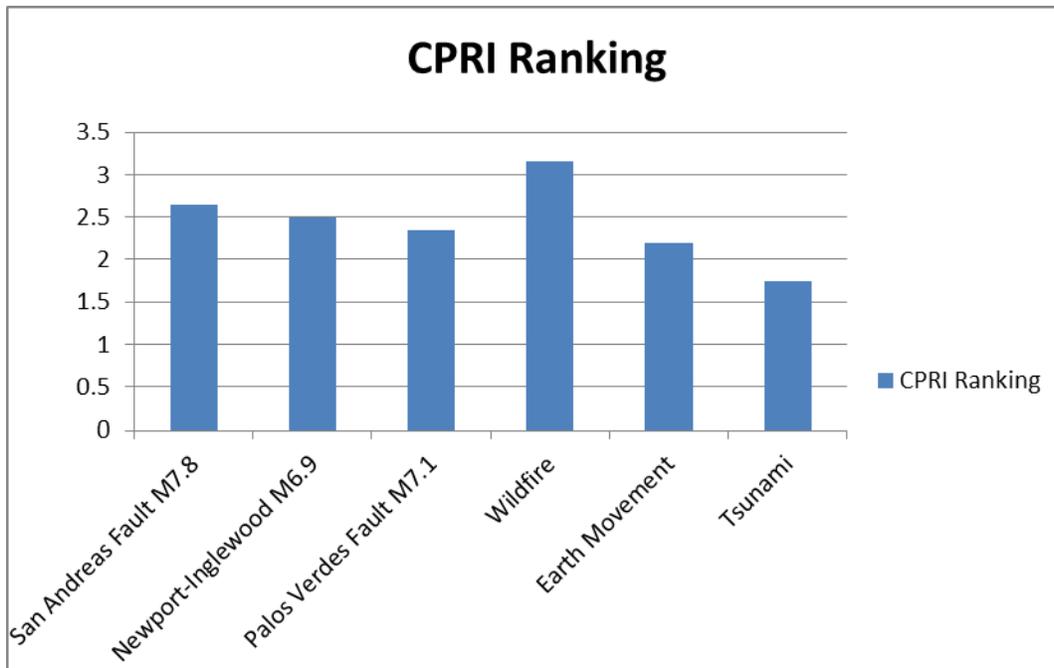

Table 3-1: Calculated Priority Risk Index  
(Source: FEMA G235 Emergency Planning Course, 2010)

| CPRI Category      | Degree of Risk |  |             | Assigned Weighting Factor |
|--------------------|----------------|--|-------------|---------------------------|
|                    | Level ID       | Description  | Index Value |                           |
| Probability        | Unlikely       | Extremely rare with no documented history of occurrences or events. Annual probability of less than 1 in 1,000 years.  | 1           | 45%                       |
|                    | Possibly       | Rare occurrences. Annual probability of between 1 in 100 years and 1 in 1,000 years.   | 2           |                           |
|                    | Likely         | Occasional occurrences with at least 2 or more documented historic events. Annual probability of between 1 in 10 years and 1 in 100 years.   | 3           |                           |
|                    | Highly Likely  | Frequent events with a well-documented history of occurrence. Annual probability of greater than 1 every year.   | 4           |                           |
| Magnitude/Severity | Negligible     | Negligible property damages (less than 5% of critical and non-critical facilities and infrastructure. Injuries or illnesses are treatable with first aid and there are no deaths. Negligible loss of quality of life. Shut down of critical public facilities for less than 24 hours.  | 1           | 30%                       |
|                    | Limited        | Slight property damage (greater than 5% and less than 25% of critical and non-critical facilities and infrastructure). Injuries or illnesses do not result in permanent disability, and there are no deaths. Moderate loss of quality of life. Shut down of critical public facilities for more than 1 day and less than 1 week. | 2           |                           |
|                    | Critical       | Moderate property damage (greater than 25% and less than 50% of critical and non-critical facilities and infrastructure). Injuries or illnesses result in permanent disability and at least 1 death. Shut down of critical public facilities for more than 1 week and less than 1 month.   | 3           |                           |
|                    | Catastrophic   | Severe property damage (greater than 50% of critical and non-critical facilities and infrastructure). Injuries and illnesses result in permanent disability and multiple deaths. Shut down of critical public facilities for more than 1 month.  | 4           |                           |
| Warning Time       | > 24 hours     | Population will receive greater than 24 hours of warning.  | 1           | 15%                       |
|                    | 12-24 hours    | Population will receive between 12-24 hours of warning.  | 2           |                           |
|                    | 6-12 hours     | Population will receive between 6-12 hours of warning.   | 3           |                           |
|                    | < 6 hours      | Population will receive less than 6 hours of warning.  | 4           |                           |
| Duration           | < 6 hours      | Disaster event will last less than 6 hours   | 1           | 10%                       |
|                    | < 24 hours     | Disaster event will last less than 6-24 hours  | 2           |                           |
|                    | < 1 week       | Disaster event will last between 24 hours and 1 week.  | 3           |                           |
|                    | > 1 week       | Disaster event will last more than 1 week  | 4           |                           |

Table 3-2: Calculated Priority Risk Index Ranking for Planning Area

| Hazard                  | Probability | Weighted 45% (x.45) | Magnitude Severity | Weighted 30% (x.3) | Warning Time | Weighted 15% (x.15) | Duration | Weighted 10% (x.1) | CPRI Ranking |
|-------------------------|-------------|---------------------|--------------------|--------------------|--------------|---------------------|----------|--------------------|--------------|
| San Andreas Fault M7.8  | 3           | 1.35                | 2                  | 0.6                | 4            | 0.6                 | 1        | 0.1                | 2.65         |
| Newport-Inglewood M6.9  | 2           | 0.9                 | 3                  | 0.9                | 4            | 0.6                 | 1        | 0.1                | 2.5          |
| Palos Verdes Fault M7.1 | 1           | 0.45                | 4                  | 1.2                | 4            | 0.6                 | 1        | 0.1                | 2.35         |
| Wildfire                | 3           | 1.35                | 3                  | 0.9                | 4            | 0.6                 | 3        | 0.3                | 3.15         |
| Earth Movement          | 2           | 0.9                 | 2                  | 0.6                | 4            | 0.6                 | 1        | 0.1                | 2.2          |
| Tsunami                 | 1           | 0.45                | 2                  | 0.6                | 4            | 0.6                 | 1        | 0.1                | 1.75         |

## 2) Profiling Hazard Events

This process describes the causes and characteristics of each hazard and what part of the planning areas facilities, infrastructure, and environment may be vulnerable to each specific hazard. A profile of each hazard discussed in this plan is provided in the Hazard-Specific Analysis (Sections 4-7). Table 3-3 indicates a generalized perspective of the community's vulnerability of the various hazards according to extent (or degree), location, and probability.

**Table 3-3: Vulnerability: Location, Extent, and Probability for Planning Area\*†**

| Hazard  | Location (Where)                 | Extent (How Big an Event)   | Probability (How Often)* |
|---|----------------------------------|---|--------------------------|
| Earthquake  | Entire Planning Area             | The Southern California Earthquake Center (SCEC) in 2007 concluded that there is a 99.7 % probability that an earthquake of M6.7 or greater will hit California within 30 years. <sup>1</sup> | Moderate                 |
| Wildfire  | Throughout Planning Area         | Severe FRAP Ratings   | High                     |
| Earth Movement  | Throughout Planning Area         | Earthquake-induced and rain-induced landslide events possibly impacting dozens of structures.   | Moderate                 |
| Tsunami   | Shoreline of Rancho Palos Verdes | Limited Run Up  | Low                      |
| * Probability is defined as: Low = 1:1,000 years, Moderate = 1:100 years, High = 1:10 years |                                  |   |                          |
| <sup>1</sup> Uniform California Earthquake Rupture Forecast                                 |                                  |   |                          |

### 3) Vulnerability Assessment/Inventory of Existing Assets

This is a combination of hazard identification with an inventory of the existing (or planned) property development(s) and population(s) exposed to a hazard. Critical facilities are of particular concern because these locations provide essential equipment or provide services to the general public that are necessary to preserve important public safety, emergency response, and/or disaster recovery functions. The critical facilities have been identified and are illustrated in Table 3-5: Critical Facilities Vulnerable to Hazards.

### 4) Risk Analysis

Estimating potential losses involves assessing the damage, injuries, and financial costs likely to be sustained in a geographic area over a given period of time. This level of analysis involves using mathematical models. The two measurable components of risk analysis are magnitude of the harm that may result and the likelihood of the harm occurring. Describing vulnerability in terms of dollar losses provides the community and the state with a common framework in which to measure the effects of hazards on assets. For each hazard where data was available, quantitative estimates for potential losses have been included in the hazard assessment. Data

#### \* ELEMENT B: HAZARD IDENTIFICATION AND RISK ASSESSMENT | B1

B1. Does the Plan include a description of the type, location, and extent of all natural hazards that can affect each jurisdiction(s)? (Requirement §201.6(c)(2)(i))

#### † ELEMENT B: HAZARD IDENTIFICATION AND RISK ASSESSMENT | B2

B2. Does the Plan include information on previous occurrences of hazard events and on the probability of future hazard events for each jurisdiction? (Requirement §201.6(c)(2)(i))

was not available to make vulnerability determinations in terms of dollar losses for all of the identified hazards. The Mitigation Actions Matrix (Section 9: Mitigation Strategies) includes an action item to conduct such an assessment in the future.

### *5) Assessing Vulnerability/Analyzing Development Trends*

This step provides a general description of land uses and development trends within the community so that mitigation options can be considered in land use planning and future land use decisions. This Plan provides a comprehensive description of the character of the planning area in Section 2: Planning Area Profile. This description includes the geography and environment, population and demographics, land use and development, housing and community development, employment and industry, and transportation and commuting patterns. Analyzing these components of the planning area can help in identifying potential problem areas and can serve as a guide for incorporating the goals and ideas contained in this Plan into other community development plans.

Hazard assessments are subject to the availability of hazard-specific data. Gathering data for a hazard assessment requires a commitment of resources on the part of participating organizations and agencies. Each hazard-specific section of the plan includes a section on hazard identification using data and information from City, county, state, or federal sources.

Regardless of the data available for hazard assessments, there are numerous strategies the Cities can use to reduce risk. These strategies are described in the action items detailed in the Mitigation Actions Matrix (Section 9: Mitigation Strategies). Mitigation strategies can further reduce disruption to critical services, reduce the risk to human life, and alleviate damage to personal and public property, and infrastructure.

## Federal Requirements for Risk Assessment

Federal regulations for local mitigation plans (44 C.F.R. Section 201.6(c) (2)) require a risk assessment. This risk assessment requirement is intended to provide information that will help communities to identify and prioritize mitigation activities that will reduce losses from the identified hazards. The Federal criteria for risk assessment and information on how the Plan meets those criteria are outlined in Table 3-4: Federal Criteria for Risk Assessment below.

**Table 3-4: Federal Criteria for Risk Assessment**

| Section 322 Plan Requirement                             | How is this addressed?   |
|--|--|
| Identifying Hazards                                      | Each hazard section includes an inventory of the best available data sources that identify hazard areas. To the extent data are available; the existing maps identifying the location of the hazard were utilized. The Executive Summary and the Risk Assessment of the Plan include a list of the hazard maps.                                  |
| Profiling Hazard Events                                  | Each hazard section includes documentation of the history, causes, and characteristics of the hazard in the planning area.   |
| Assessing Vulnerability:<br>Identifying Assets           | Where data is available, the vulnerability assessment for each hazard addressed in the Plan includes an inventory of all publicly owned land within hazardous areas. Each hazard section provides information on vulnerable areas within the planning area. Mitigation actions for each hazard can be found in Section 9: Mitigation Strategies. |
| Assessing Vulnerability:<br>Estimating Potential Losses  | The Risk Assessment identifies key critical facilities that provide services to the planning area. Assessments have been completed for the hazards addressed in the plan, and quantitative estimates were made for each hazard where data was available.   |
| Assessing Vulnerability:<br>Analyzing Development Trends | The Planning Area Profile Section of this plan provides a description of the development trends in the planning area, including the geography and environment, population and demographics, land use and development, housing and community development, employment and industry, and transportation and commuting patterns.                     |

## Critical and Essential Facilities

Examples of facilities critical to government response activities (i.e., life safety, property, and environmental protection) could include: local government 9-1-1 dispatch centers, local government emergency operations centers, local police and fire stations, local public works facilities, local communications centers, schools (shelters), and hospitals. Also, facilities that, if damaged, could cause serious secondary impacts are also considered "critical." A hazardous materials facility is one example of this type of critical facility.

Essential facilities are those facilities that are vital to the continued delivery of key City services or that may significantly impact the City's ability to recover from the disaster. These facilities include but are not limited to: schools (hosting shelters); buildings such as the jail, law enforcement center, public services building, community corrections center, the courthouse, juvenile services building, and other public facilities.

The following tables illustrate the critical and essential facilities within the planning area.

**Table 3-5: Critical Facilities Vulnerable to Hazards**

| Name of Facility                        | Address   | Earthquake | Wildfire | Earth Movement | Tsunami |
|---|---|------------|----------|----------------|---------|
| California Water Service Reservoir      | Palos Verdes Drive North/Palos Verdes Drive East (SW corner), RHE | X          | X        | X              |         |
| California Water Service Reservoir      | 3960 East Crest Road, RPV   | X          | X        |                |         |

## Land and Development

Development in Southern California from the earliest days was a cycle of boom and bust. The Second World War however dramatically changed that cycle. Military personnel and defense workers came to Southern California to fill the logistical needs created by the war effort. The available housing was rapidly exhausted and existing commercial centers proved inadequate for the influx of people. Immediately after the war, construction began on the freeway system, and the face of Southern California was forever changed. Home developments and shopping centers sprung up everywhere and within a few decades the urbanized portions of Southern California were virtually built out. This pushed new development further and further away from the urban center.

The General Plans of the two cities address the use and development of private land, including residential and commercial areas. This plan is one of the City's most important tools in addressing environmental challenges including transportation and air quality; growth management; conservation of natural resources; clean water and open spaces. Although the planning area is distinct from most of the surrounding areas in Los Angeles County due to its unique topography and low density pattern of development, its exposure to hazards is largely the same than those that affect all of Southern California.

## Impacts to Types of Structures

The RPV and RHE General Plans identify a broad range of land uses and the Building Code identifies several building types. In general terms, structures are categorized as residential, commercial, institutional, industrial, recreational, or agricultural.

**Table 3-7: Impacts to Existing and Future Types of Structures in City of Rancho Palos Verdes**

| Category of Structure                     | Earthquake | Wildfire | Earth Movement | Tsunami |
|---|------------|----------|----------------|---------|
| Natural Environment / Hazard Area (17.7%) | X          | X        | X              |         |
| <b>Urban Land Areas:</b>                  |            |          |                |         |
| Residential (63.3%)                       | X          | X        | X              | X       |
| Commercial (3.0%)                         | X          | X        |                |         |
| Institutional (3.5%)                      | X          | X        | X              |         |
| Recreational (5.4%)                       | X          | X        | X              |         |
| Utility (.27%)                            | X          | X        |                |         |
| Open Space Preservation (6.8%)            | X          | X        |                |         |

**Table 3-8: Impacts to Existing and Future Types of Structures in City of Rolling Hills Estates**

| Category of Structure<br>(% of Total Land Use) | Earthquake | Wildfire | Earth Movement | Tsunami |
|--|------------|----------|----------------|---------|
| Residential (59%)                              | X          | X        | X              |         |
| Commercial/Industrial<br>(7%)                  | X          | X        | X              |         |
| Open Space (15%)                               | X          | X        | X              |         |
| Institutional/Public<br>(15%)                  | X          | X        | X              |         |

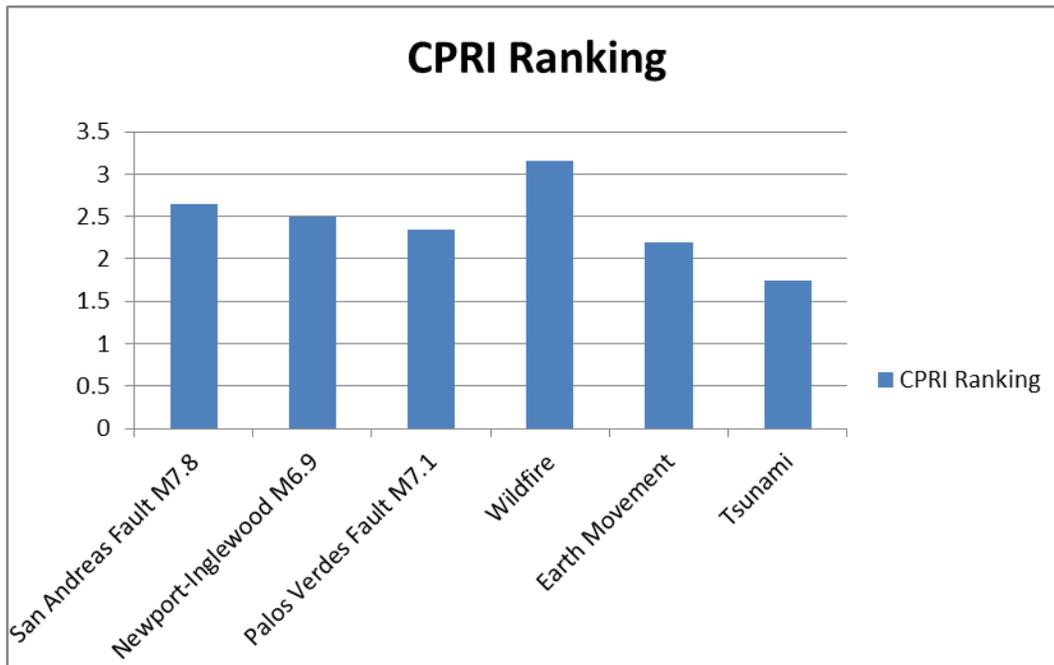

**Table 3-9: Hazards Summary**

| Hazards               | Earthquake | Wildfire | Earth Movement | Tsunami |
|-----------------------|------------|----------|----------------|---------|
| Rancho Palos Verdes   | X          | X        | X              | X       |
| Rolling Hills Estates | X          | X        | X              |         |

## Summary

Hazard mitigation strategies can reduce the impacts concentrated at large employment and industrial centers, public infrastructure, and critical facilities. Hazard mitigation for industries and employers may include developing relationships with emergency management services and their employees before disaster strikes, and establishing mitigation strategies together. Collaboration among the public and private sector to create mitigation plans and actions can reduce the impacts of hazards.

## Section 4: Earthquake Hazards

| Calculated Priority Risk Index (CPRI) |                   |
|---------------------------------------|-------------------|
| Probability:                          | Likely            |
| Magnitude/Severity:                   | Critical          |
| Warning Time:                         | Less than 6 hours |
| Duration:                             | Less than 6 hours |

### Why Are Earthquakes a Threat to the Planning Area?\*

In terms of earthquakes, historically the planning area has been extremely lucky. Like the majority of the Los Angeles basin, the Palos Verdes Peninsula was largely uninhabited rangeland during the 7.9M Fort Tejon Earthquake in 1857. Articles in the Palos Verdes News indicate that the planning area sustained only minor property damage and no loss of life as a result of the major earthquakes that have occurred in the Los Angeles area since the area first began to develop rapidly following World War II.

The earliest report of any local earthquake-related damage comes from an article that appeared in the Palos Verdes News on April 10, 1968. The newspaper reported on two shocks, 6M and 7.25M in strength, respectively, that occurred a few days earlier broke a water pipe in a drug store located in the City of Palos Verdes Estates; consequently flooding the store's basement and causing an estimated \$4,000 to \$5,000 in damage. On February 10, 1971, the Palos Verdes News reported that the 6.6M San Fernando Earthquake resulted in 900 homes being

#### \* ELEMENT B: HAZARD IDENTIFICATION AND RISK ASSESSMENT | B2

B2. Does the Plan include information on previous occurrences of hazard events and on the probability of future hazard events for each jurisdiction? (Requirement §201.6(c)(2)(i))

without power in the Highridge area north of Crest Road in Rancho Palos Verdes for about an hour. Similarly, an article that appeared in the paper on October 3, 1987 reported that the 5.9M Whittier Narrows Earthquake damaged a bank building in the Peninsula Shopping Center in Rolling Hills Estates, although the extent of the damage was not indicated. In addition, the article mentioned that cellular telephone service was disrupted most of the morning, but no power outages occurred.

The 6.9M Northridge Earthquake of 1994 caused the most widespread, although still relatively minor damage within the planning area. On January 20, 1994, the Palos Verdes News reported that local damage consisted of fire and smoke damage to a liquor store on Western Avenue in Rancho Palos Verdes caused by liquor bottles falling from shelves and then igniting when a refrigeration unit sparked. In the same area, a long section of retaining wall along Western Avenue and Delasonde Drive collapsed onto the public sidewalk. In Rolling Hills Estates, scores of books fell from the shelves at the main library and several shops in the Peninsula Shopping Center in Rolling Hills Estates lost a day of business cleaning up fallen merchandise in the wake of the trembler. Additionally, in the adjacent community of City of Palos Verdes Estates, a portion of the road at Via Valmonte at Via Azalea buckled, breaking a natural gas line under the street. (Palos Verdes News, 1937-2004)

The planning area is located in a seismically active area and near several of the many active and potentially active faults in Southern California. According to the RPV General Plan, two faults are present on the Peninsula: the Palos Verdes and Cabrillo Faults (see Map 4-3: Planning Area Fault Map). The active Palos Verdes Fault trends northwest-southeast and marks the eastern termination of the Palos Verdes Hills. The potentially active Cabrillo Fault also trends northwest-southeast and extends from Cabrillo Beach to near the center of the Peninsula. The Palos Verdes Fault is considered a source of significant earthquake hazard and the Cabrillo Fault is a potentially moderate earthquake hazard. (Source: RPV General Plan, Draft 6/2010)

The Palos Verdes Fault is within a mile of the Palos Verdes Peninsula and poses the most significant earthquake hazard to the planning area due to its proximity. Although Holocene activity has been demonstrated in the southern offshore segment of the fault, the recurrence interval and magnitude of the most recent displacement is still not well characterized and as such the CGS considers it a "Potentially Active" fault. The effect a maximum credible earthquake on the Palos Verdes Fault would have to Southern California is considerable. This potential scenario is estimated to cause losses of \$30 billion in building damage, 80 to 1,050 deaths, and 2,400 to 19,000 injuries (OES, 2007).

In addition to the Palos Verdes and Cabrillo Faults, several other faults are located within the region that could have an impact on the planning area. According to the MHFP Threat Assessments for both cities, the Peninsula is in the vicinity of several known active and potentially active earthquake faults including the San Andreas, the San Jacinto, Whittier-Elsinore, and the Newport-Inglewood Fault Zones. Scientists have identified almost 100 faults in the Los Angeles area known to be capable of a magnitude 6.0 or greater earthquake. The January 17, 1994 magnitude 6.7 Northridge Earthquake (thrust fault), which produced severe ground motions, caused 57 deaths, 9,253 injuries and left over 20,000 displaced. Scientists have stated that such devastating shaking should be considered the norm near any large thrust earthquake.

## Regulatory Background

The State regulates development within California to reduce or mitigate potential hazards from earthquakes or other geologic hazards. Development in potentially seismically active areas is also governed by the Alquist-Priolo Earthquake Fault Zoning Act and the Seismic Hazards Mapping Act.

Chapter 16A, Division IV of the California Building Code (CBC), titled “Earthquake Design” states that “The purpose of the earthquake provisions herein is primarily to safeguard against major structural failures or loss of life.” The CBC and the Uniform Building Code (UBC) regulate the design and construction of excavations, foundations, building frames, retaining walls, and other building elements to mitigate the effects of seismic shaking and adverse soil conditions. The procedures and limitations for the design of structures are based on site characteristics, occupancy type, configuration, structural system, height, and seismic zonation. Seismic zones are mapped areas (Figure 16A-2 of the CBC and Figure 16-2 of the UBC) that are based on proximity to known active faults and the potential for future earthquakes and intensity of seismic shaking. Seismic zones range from 0 to 4, with areas mapped as Zone 4 being potentially subject to the highest accelerations due to seismic shaking and the shortest recurrence intervals. According to the 1997 UBC, and the 1998 CBC, the planning area is within Seismic Zone 4.

---

The 1933 Long Beach Earthquake resulted in the Field Act, affecting school construction.

---

The 1933 Long Beach Earthquake resulted in the Field Act, affecting school construction. The 1971 Sylmar Earthquake brought another set of increased structural standards. Similar re-evaluations occurred after the 1989 Loma Prieta Earthquake and 1994 Northridge Earthquake. These code changes have resulted in stronger and more earthquake resistant structures.

The purpose of the Alquist-Priolo Earthquake Fault Zoning Act of 1972 (renamed in 1994) is “to regulate development near active faults so as to mitigate the hazard of surface fault rupture.” The State Geologist (chief of the Division of Mines and Geology) is required to delineate Earthquake Fault Zones (formerly known as “Special Studies Zones”) along known active faults. As defined by the California Division of Mines and Geology (DMG), an active fault is one which has had surface displacement within Holocene time (roughly the last 11,000 years) and/or has an instrumental record of seismic activity. Potentially active faults are those which show evidence of surface displacement during Quaternary time (roughly the last 2 million years), but for which evidence of Holocene movement has not been established. The DMG evaluates faults on an individual basis to determine if a fault will be classified as an Alquist-Priolo Earthquake Fault Zone. In general, faults must meet certain DMG criteria, including seismic activity, historic rupture, and geologic evidence to be zoned as an Earthquake Fault Zone. Cities and counties affected by the zones must regulate certain development within the zones. They must withhold development permits for sites within the zones until geologic investigations demonstrate that the sites are not threatened by surface displacement from future faulting. Typically, structures for human occupancy are not allowed within 50 feet of the trace of an active fault.

The Seismic Hazard Mapping Act was adopted in 1990 for the purpose of protecting public safety from the effects of strong ground shaking, liquefaction, landslides, or other ground failure caused by earthquakes. The Seismic Hazard Mapping Act requires that the State Geologist delineate the various seismic hazard zones. Cities, counties, or other permitting authorities are

required to regulate certain development projects within the zones. They must withhold development permits for a site within a zone until the geologic conditions are investigated and appropriate mitigation measures, if any, are incorporated into the development plans. In addition, sellers (and their agents) of real property within a mapped hazard zone must disclose that the property lies within such a zone at the time of sale.

Following major earthquakes, extensive search and rescue operations may be required to assist trapped or injured persons. Emergency medical care, food and temporary shelter would be required for injured or displaced persons. In the event of a truly catastrophic earthquake, identification and burial of the dead would pose difficult problems. Mass evacuation may be essential to save lives, particularly in areas below dams and/or reservoirs. Many families could be separated, particularly if the earthquake should occur during working hours, and a personal inquiry or locator system would be essential to maintain morale.

Emergency operations could be seriously hampered by the loss of communications and damage to transportation routes within, and to and from, the disaster area and by the disruption of public utilities and services.

Extensive federal assistance could be required and could continue for an extended period. Efforts would be required to remove debris and clear roadways, demolish unsafe structures, assist in reestablishing public services and utilities, and provide continuing care and welfare for the affected population, including temporary housing for displaced persons.

In general, the population is less at risk during non-work hours (if at home) as wood-frame structures are relatively less vulnerable to major structural damage than are typical commercial and industrial buildings. Transportation problems are intensified if an earthquake occurs during work hours, as significant numbers of employees would be stranded in the planning area. An earthquake occurring during work hours would clearly create major transportation problems for those displaced workers.

## Measuring and Describing Earthquakes

An earthquake is a sudden motion or trembling that is caused by a release of strain accumulated within or along the edge of the Earth's tectonic plates. The effects of an earthquake can be felt far beyond the site of its occurrence. They usually occur without warning and, after just a few seconds, can cause massive damage and extensive casualties. Common effects of earthquakes are ground motion and shaking, surface fault ruptures, and ground failure. Ground motion is the vibration or shaking of the ground during an earthquake. When a fault ruptures, seismic waves radiate, causing the ground to vibrate. The severity of the vibration increases with the amount of energy released and decreases with distance from the causative fault or epicenter. Soft soils can further amplify ground motions. The severity of these effects is dependent on the amount of energy released from the fault or epicenter.

One way to express an earthquake's severity is to compare its acceleration to the normal acceleration due to gravity. The acceleration due to gravity is often called "g." A ground motion with a peak ground acceleration of 100%g is very severe. Peak Ground Acceleration (PGA) is a measure of the strength of ground motion. PGA is used to project the risk of damage from future earthquakes by showing earthquake ground motions that have a specified probability (10%, 5%, or 2%) of being exceeded in 50 years. These ground motion values are used for

reference in construction design for earthquake resistance. The ground motion values can also be used to assess relative hazard between sites, when making economic and safety decisions. Another tool used to describe earthquake intensity is the Magnitude Scale. The Magnitude Scale is sometimes referred to as the Richter Scale. The two are similar but not exactly the same. The Magnitude Scale was devised as a means of rating earthquake strength and is an indirect measure of seismic energy released. The Scale is logarithmic with each one-point increase corresponding to a 10-fold increase in the amplitude of the seismic shock waves generated by the earthquake. In terms of actual energy released, however, each one-point increase on the Richter Scale corresponds to about a 32-fold increase in energy released. Therefore, a Magnitude 7 (M7) earthquake is 100 times (10 X 10) more powerful than a M5 earthquake and releases 1,024 times (32 X 32) the energy.

An earthquake generates different types of seismic shock waves that travel outward from the focus or point of rupture on a fault. Seismic waves that travel through the earth's crust are called body waves and are divided into primary (P) and secondary (S) waves. Because P waves move faster (1.7 times) than S waves, they arrive at the seismograph first. By measuring the time delay between arrival of the P and S waves and knowing the distance to the epicenter, seismologists can compute the magnitude for the earthquake.

The duration of an earthquake is related to its magnitude but not in a perfectly strict sense. There are two ways to think about the duration of an earthquake. The first is the length of time it takes for the fault to rupture and the second is the length of time shaking is felt at any given point (e.g. when someone says "I felt it shake for 10 seconds" they are making a statement about the duration of shaking). (Source: www.usgs.gov)

The Modified Mercalli Scale (MMI) is another means for rating earthquakes, but one that attempts to quantify intensity of ground shaking. Intensity under this scale is a function of distance from the epicenter (the closer to the epicenter the greater the intensity), ground acceleration, duration of ground shaking, and degree of structural damage. This rates the level of severity of an earthquake by the amount of damage and perceived shaking (Table 4-1: Modified Mercalli Intensity Scale).

**Table 4-1: Modified Mercalli Intensity Scale**

| MMI Value | Description of Shaking Severity | Summary Damage Description Used on Maps since Maps | Full Description   |
|-----------|---------------------------------|--|--|
| I         |                                 |  | Not Felt   |
| II        |                                 |  | Felt by persons at rest, on upper floors, or favorably placed.   |
| III       |                                 |  | Felt indoors. Hanging objects swing. Vibration like passing of light trucks. Duration estimated. May not be recognized as an earthquake.   |
| IV        |                                 |  | Hanging objects swing. Vibration like passing of heavy trucks; or sensation of a jolt like a heavy ball striking the walls. Standing motorcars rock. Windows, dishes, doors rattle. In the upper |

**Table 4-1: Modified Mercalli Intensity Scale**

| MMI Value | Description of Shaking Severity | Summary Damage Description Used on Maps since Maps | Full Description  |
|-----------|---------------------------------|--|---|
|           |                                 |  | range of IV, wooden walls and frame creak.  |
| V         | Light                           | Pictures Move                                      | Felt outdoors; direction estimated. Sleepers wakened. Liquids disturbed, some spilled. Small unstable objects displaced or upset. Doors swing, close, open. Shutters, pictures move. Pendulum clock stop, start, change rate.   |
| VI        | Moderate                        | Objects Fall                                       | Felt by all. Many frightened and run outdoors. Persons walk unsteadily. Windows, dishes, glassware broken. Knickknacks, books, etc., off shelves. Pictures off walls. Furniture moved or overturned. Weak plaster and masonry D cracked.  |
| VII       | Strong                          | Nonstructural Damage                               | Difficult to stand. Noticed by drivers of motorcars. Hanging objects quiver. Furniture broken. Damage to masonry, including cracks. Weak chimneys broken at roofline. Fall of plaster, loose bricks, stones, tiles, cornices. Some cracks in masonry C. Small slides and caving in along sand or gravel banks. Concrete irrigation ditches damaged.                         |
| VIII      | Very Strong                     | Moderate Damage                                    | Steering of motorcars affected. Damage to masonry C, partial collapse. Some damage to masonry B; none to masonry A. Fall of stucco and some masonry walls. Twisting, fall of chimneys, factory stacks, monuments, towers, and elevated tanks. Frame houses moved on foundations if not bolted down; loose panel walls thrown out. Cracks in wet ground and on steep slopes. |
| IX        | Violent                         | Heavy Damage                                       | General panic. Damage to masonry buildings ranges from collapse to serious damage unless modern design. Wood-frame structures rack, and, if not bolted, shifted off foundations. Underground pipes broken.  |
| X         | Very Violent                    | Extreme Damage                                     | Most masonry and frame structures destroyed with their foundations. Some well-built wooden structures and bridges destroyed. Serious damage to dams, dikes, embankments. Large landslides. Water thrown on banks of canals, rivers, lakes, etc. Sand and mud shifted horizontally on beaches and flat land.   |
| XI        |                                 |  | Rails bent greatly. Underground pipelines completely out of services.   |
| XII       |                                 |  | Damage nearly total. Large rock masses displaced. Lines of sight and level distorted. Objects thrown into air.  |

## Historic Earthquakes in Southern California

Since seismologists started recording and measuring earthquakes, there have been tens of thousands of recorded earthquakes in Southern California, most with a magnitude below three. No community in Southern California is beyond the reach of a damaging earthquake. Table 4-2: Earthquake Events in the Southern California Region describes the historical earthquake events that have affected Southern California.

Historically, the planning area has generally been spared a major destructive earthquake. However, based on a search of earthquake databases of the United States Geological Survey (USGS) - National Earthquake Information Center (NEIC), several major earthquakes (Magnitude 6.0 or more) have been recorded within approximately 100 kilometers of the project area since 1769.

**Table 4-2: Historical Earthquakes near Los Angeles County**  
 (Source: [http://earthquake.usgs.gov/regional/sca/ca\\_eqs.php](http://earthquake.usgs.gov/regional/sca/ca_eqs.php))

| Date       | Location              | Maximum Magnitude (M)* |
|------------|-----------------------|------------------------|
| 12/8/1812  | Wrightwood            | 7.0                    |
| 12/16/1858 | San Bernardino Region | 6.0                    |
| 7/30/1894  | Lytle Creek Region    | 6.0                    |
| 4/21/1918  | San Jacinto           | 6.9                    |
| 7/23/1923  | San Bernardino Region | 6.0                    |
| 3/11/1933  | Long Beach            | 6.3                    |
| 2/9/1971   | San Fernando          | 6.5                    |
| 10/1/1987  | Whittier Narrows      | 5.8                    |

To better understand the earthquake hazard, the scientific community has looked at historical records and accelerated research on those faults that are the sources of the earthquakes occurring in the Southern California region. Historical earthquake records can generally be divided into records of the pre-instrumental period and the instrumental period. In the absence of instrumentation, the detection of earthquakes are based on observations and felt reports, and are dependent upon population density and distribution. Since California was sparsely populated in the 1800s, the detection of pre-instrumental earthquakes is relatively difficult. However, two very large earthquakes, the Fort Tejon in 1857 (M7.9) and the Owens Valley in 1872 (M7.6) are evidence of the tremendously damaging potential of earthquakes in Southern California. In more recent times two M7.3 earthquakes struck Southern California, in Kern County (1952) and Landers (1992).

The damage from these four large earthquakes was limited because they occurred in areas which were sparsely populated at the time they happened. The seismic risk is much more severe today than in the past because the population at risk is in the millions, rather than a few hundred or a few thousand persons.

## Impact of Earthquakes in the Planning Area\*

Based on the risk assessment, it is evident that earthquakes will continue to have potentially devastating economic impacts to certain areas of the planning area. Impacts that are not quantified, but can be anticipated in future events, include:

- ✓ Injury and loss of life;
- ✓ Commercial and residential structural damage;
- ✓ Disruption of and damage to public infrastructure;
- ✓ Secondary health hazards (e.g. mold and mildew);
- ✓ Damage to roads/bridges resulting in loss of mobility;
- ✓ Significant economic impact (jobs, sales, tax revenue) upon the community;
- ✓ Negative impact on commercial and residential property values; and
- ✓ Significant disruption to students and teachers as temporary facilities and relocations would likely be needed.

## Severity

A major earthquake occurring in or near the planning area could cause many deaths and injuries, extensive property damage, fires, hazardous material spills, and other dangers. Aftershocks and the secondary effects of fire, hazardous material/chemical accidents, reservoirs, and waterways could aggravate the situation.

The time of day and season of the year would have a profound impact on the number of dead and injured and the amount of property damage. Such an earthquake could exceed the response capabilities of the individual cities, Los Angeles County Operational Area, and the State of California Office of Emergency Services. Support of damage control and disaster relief could be required from other local governments and private organizations, as well as the state and federal governments.

Extensive search and rescue operations could be required to assist trapped persons. Mass evacuation could be essential to save lives, particularly in areas downwind from hazardous material releases. Emergency medical care, food, and temporary shelter could be required by injured or displaced persons.

Many families could be separated, particularly if the earthquake occurs during working hours. A personal inquiry or locator system could be essential to maintain morale. Emergency operations could be seriously hampered by a loss of communications, damage to transportation routes, and/or disruption of public utilities and services.

The economic impact on the Cities could be considerable in terms of lost employment and lost tax base. A major earthquake could

---

A major earthquake could disrupt, damage, or destroy computer facilities, which could curtail the operations of banks, insurance companies, and other elements of the financial community for several days or weeks.

### \* ELEMENT B: HAZARD IDENTIFICATION AND RISK ASSESSMENT | B3

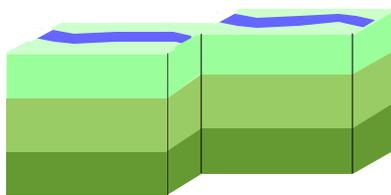

B3. Is there a description of each identified hazard's impact on the community as well as an overall summary of the community's vulnerability for each jurisdiction? (Requirement §201.6(c)(2)(ii))

disrupt, damage, or destroy computer facilities, which could curtail the operations of banks, insurance companies, and other elements of the financial community for several days or weeks. This could affect the ability of local government, business, and residents to make payments and purchases. (Source: California Division of Mines and Geology, Special Publication 60, *Earthquake Planning Scenario for a Magnitude 8.3 Earthquake on the San Andreas Fault in Southern California*, 1982.)

## Causes of Earthquakes in Southern California

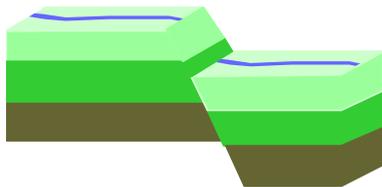

### *Earthquake Faults*

A fault is a fracture between blocks of the earth's crust where either side moves relative to the other along a parallel plane to the fracture.

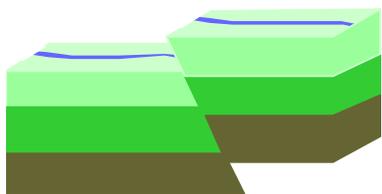

### *Strike-slip Faults*

Strike-slip faults are vertical or almost vertical rifts where the earth's plates move mostly horizontally. From the observer's perspective, if the opposite block looking across the fault moves to the right, the slip style is called a right lateral fault; if the block moves left, the shift is called a left lateral fault.

### *Dip-slip Faults*

Dip-slip faults are slanted fractures where the blocks mostly shift vertically. If the earth above an inclined fault moves down, the fault is called a normal fault, but when the rock above the fault moves up, the fault is called a reverse fault.

### *Thrust Faults*

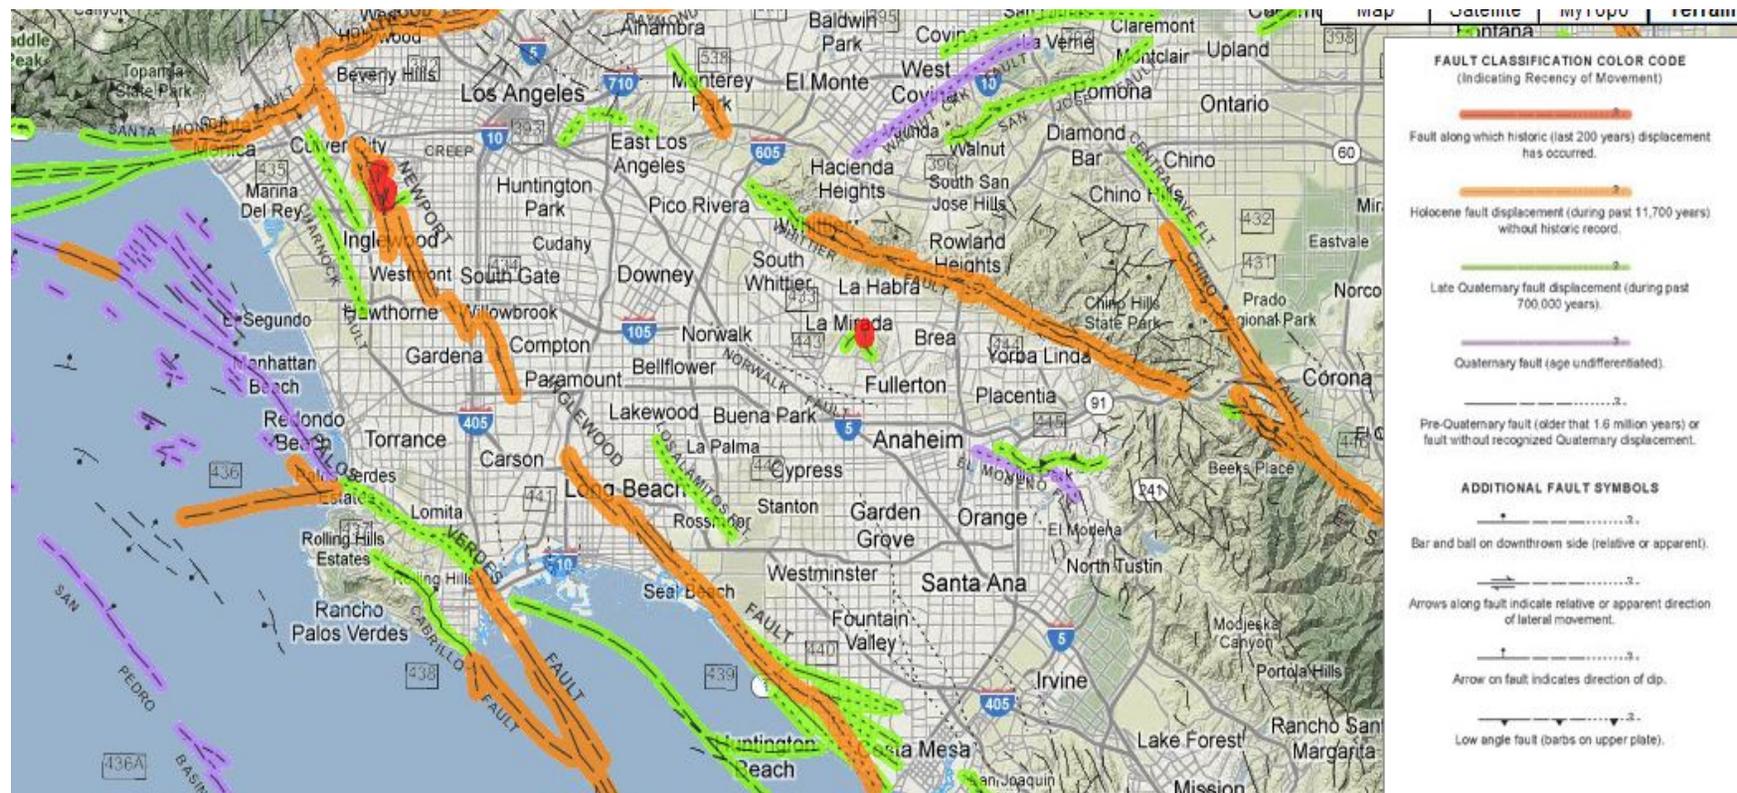

Thrust faults have a reverse fault with a dip of 45 ° or less.

Cal Tech has investigated the San Andreas Fault at Pallett Creek. "The record at Pallett Creek shows that rupture has recurred about every 130 years, on average, over the past 1500 years. But actual intervals have varied greatly, from less than 50 years to more than 300. The physical cause of such irregular recurrence remains unknown." Damage from a great quake on the San Andreas would be widespread throughout Southern California.

# Earthquake Hazard Assessment

Map 4-1: Planning Area Fault Map illustrates several major active faults exist in Los Angeles County, including the San Andreas, Newport Inglewood, Elsinore, San Joaquin Hills Fault, Whittier, and Norwalk. The closest active faults to the planning area are the Newport-Inglewood and Whittier fault zones. Other faults such as the Cabrillo and Palos Verdes faults are less than a few miles from the planning area but are considered potentially active faults. The largest active fault near the planning area is the San Andreas Fault which is further than 50 miles northeast from the planning area.

Map 4-1: Planning Area Fault Map  
 (Source: State of California Department of Conservation)

### **Earthquake Probable Events**

(Source: Southern California Earthquake Data Center, <http://www.data.scec.org/>)

#### **Elsinore Fault Zone**

TYPE OF FAULTING: *right-lateral strike-slip*

LENGTH: *about 180 km (not including the Whittier, Chino, and Laguna Salada Faults)*

NEARBY COMMUNITIES: *Temecula, Lake Elsinore, Julian*

PROBABLE MAGNITUDES: *M6.5 - 7.5*

#### **Newport-Inglewood Fault Zone**

TYPE OF FAULTING: *right-lateral; local reverse slip associated with fault steps*

LENGTH: *75 km*

NEAREST COMMUNITIES: *Culver City, Inglewood, Gardena, Compton, Signal Hill, Long Beach, Seal Beach, Huntington Beach, Newport Beach, Costa Mesa*

PROBABLE MAGNITUDES: *M6.0 - 7.4*

#### **Palos Verdes Fault Zone**

TYPE OF FAULT: *right-reverse*

LENGTH: *roughly 80 km*

NEARBY COMMUNITIES: *San Pedro, Palos Verdes Estates, Torrance, Redondo Beach*

PROBABLE MAGNITUDES: *M6.0 - 7.0 (or greater?); fault geometries may allow only partial rupture at any one time*

#### **San Andreas Fault Zone**

TYPE OF FAULT: *right-lateral strike-slip*

LENGTH: *1200 km (550 km south from Parkfield, CA and 650km northward)*

NEARBY COMMUNITY: *Parkfield, Frazier Park, Palmdale, Wrightwood, San Bernardino, Banning, Indio*

PROBABLE MAGNITUDES: *M6.8 - 8.0*

#### **San Jacinto Fault Zone**

TYPE OF FAULTING : *right-lateral strike-slip; minor right-reverse*

LENGTH: *210 km, including Coyote Creek Fault*

NEARBY COMMUNITIES: *Lytle Creek, San Bernardino, Loma Linda, San Jacinto, Hemet, Anza, Borrego Springs, Ocotillo Wells*

PROBABLE MAGNITUDES: *M6.5 - 7.5*

#### **Whittier Fault**

TYPE OF FAULTING: *right-lateral strike-slip with some reverse slip*

LENGTH: *roughly 40 km*

NEARBY COMMUNITIES: *Yorba Linda, Hacienda Heights, Whittier*

PROBABLE MAGNITUDES: *M6.0 - 7.2*

### *Vulnerability Assessment*

The effects of earthquakes span a large area, and large earthquakes occurring in many parts of the Southern California region would probably be felt throughout the region. However, the degree to which the earthquakes are felt, and the damages associated with them may vary. At risk from earthquake damage are large stocks of old buildings and bridges; many high-tech and hazardous materials facilities; extensive sewer, water, and natural gas pipelines; earth dams; petroleum pipelines; and other critical facilities and private property located in the county. The

relative or secondary earthquake hazards, which are liquefaction, ground shaking, amplification, and earthquake-induced landslides, are just as devastating as the earthquake.

## Earthquake Related Hazards

Ground shaking, landslides, liquefaction, and amplification are the specific hazards associated with earthquakes. The severity of these hazards depends on several factors, including soil and slope conditions, proximity to the fault, earthquake magnitude, and the type of earthquake.

### *Ground Shaking*

Ground shaking is the motion felt on the earth's surface caused by seismic waves generated by the earthquake. It is the primary cause of earthquake damage. The strength of ground shaking depends on the magnitude of the earthquake, the type of fault, and distance from the epicenter (where the earthquake originates). Buildings on poorly consolidated and thick soils will typically see more damage than buildings on consolidated soils and bedrock. Seismic activity along nearby or more distant fault zones are likely to cause ground shaking within the planning area.

### *Fault Rupture*

The potential for ground rupture due to fault movement is related to the seismic activity of known fault zones. Known active or potentially active faults that could be the site of ground rupture are limited to the Palos Verdes fault zone which traverses the extreme northeastern corner of the Palos Verdes Peninsula (Source: City of RPV General Plan, Safety Element). Compared with the more active recognized fault zones, the potential for ground rupture due to seismic activity in the City is considered low.

### *Earthquake-Induced Landslide Potential*

Generally, these types of failures consist of rock falls, disrupted soil slides, rock slides, soil lateral spreads, soil slumps, soil block slides, and soil avalanches. Areas having the potential for earthquake-induced landslides generally occur in areas of previous landslide movement, or where local topographic, geological, geotechnical, and subsurface water conditions indicate a potential for permanent ground displacements.

Areas considered for earthquake-induced landslides are generally found in the hill and canyon areas of the planning area and are shown on Maps 4-8 thru 4-10. The landslide potential zones were compiled from USGS. Mapped earthquake-induced landslide potential zones are intended to prompt more detailed, site specific geotechnical studies as required by the Seismic Hazard Mapping Act.

---

Soil liquefaction is a seismically induced form of ground failure, which has been a major cause of earthquake damage in southern California.

---

### *Earthquake-Induced Landslides*

Earthquake-induced landslides are secondary earthquake hazards that occur from ground shaking. They can destroy the roads, buildings, utilities, and other critical facilities necessary to

respond and recover from an earthquake. Many communities in Southern California have a high likelihood of encountering such risks, especially in areas with steep slopes.

### *Liquefaction*

Liquefaction occurs when ground shaking causes wet granular soils to change from a solid state to a liquid state. This results in the loss of soil strength and the soil's ability to support weight. Buildings and their occupants are at risk when the ground can no longer support these structures. Liquefaction generally occurs during significant earthquake activity, and structures located on soils such as silt or sand may experience significant damage during an earthquake due to the instability of structural foundations and the moving earth. Many communities in Southern California are built on ancient river bottoms and have sandy soil. In some cases this ground may be subject to liquefaction, depending on the depth of the water table.

Soil liquefaction is a seismically-induced form of ground failure, which has been a major cause of earthquake damage in southern California. During the 1971 San Fernando and 1994 Northridge Earthquakes, significant damage to roads, utility pipelines, buildings, and other structures in the Los Angeles area were caused by liquefaction. Research and historical data indicate that loose, granular materials situated at depths of less than 50 feet with fine (silt and clay) contents of less than 30 percent, which are saturated by a relatively shallow groundwater table are most susceptible to liquefaction. These geological and groundwater conditions exist in parts of southern California and the planning area, typically in valley regions and alleviated floodplains.

For liquefaction to occur, three general conditions must be met. The first condition – strong ground shaking of relatively long duration – can be expected to occur in the planning area as a result of an earthquake on any of the several active faults in the region. The second condition – loose, or unconsolidated, recently deposited sediments consisting primarily of silt and sand – occurs in a large portion of the valley floors, and in the larger canyon bottoms prevalent throughout Los Angeles County. The third condition is water saturated sediments within about 50 feet of the surface.

In accordance with the Seismic Hazard Mapping Act, the California Division of Mines and Geology has evaluated liquefaction susceptibility for most of the planning area. Maps 4-8 through 4-10, Seismic Hazard Zones show the results of these studies.

### *Structure Failure*

The planning area is fortunate that most of its buildings have been built under recent building codes and design criteria. In fact, a substantial amount of construction has occurred in the planning area under design standards that take into account some of the lessons learned from the 1971 Sylmar Earthquake.

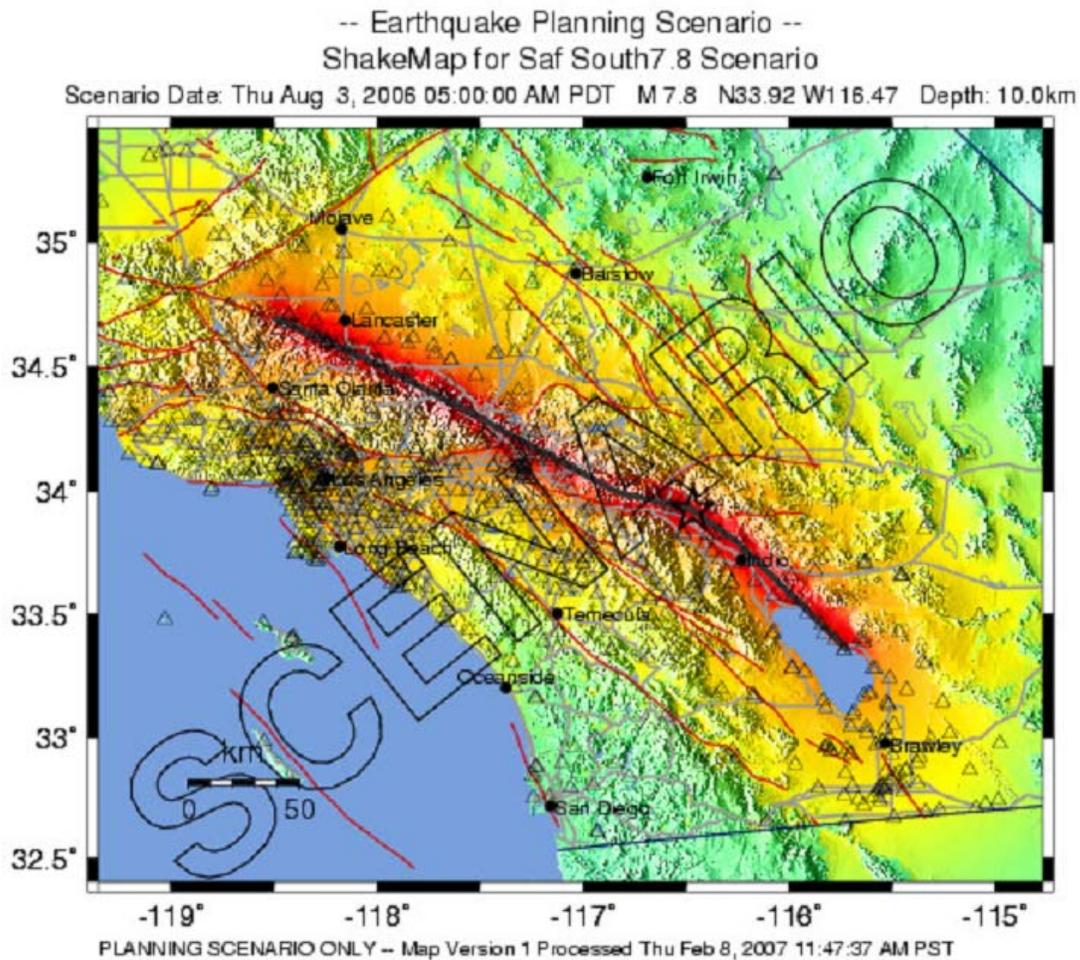

### *Amplification*

Soils and soft sedimentary rocks near the earth's surface can modify ground shaking caused by earthquakes. One of these modifications is amplification. Amplification increases the magnitude of the seismic waves generated by the earthquake. The amount of amplification is influenced by the thickness of geologic materials and their physical properties. Buildings and structures built on soft and unconsolidated soils can face greater risk. Amplification can also occur in areas with deep sediment filled basins and on ridge top.

S12 Whittier Fault Scenario M 6.8

**Map 4-6: Seismic Hazard Zones – Redondo Beach Quadrangle**  
 (Source: State of California Department of Conservation)

**PURPOSE OF MAP**  
 This map was created and modified in fulfilling their responsibilities for protecting the public safety from the effects of earthquake-induced ground failure as required by the Seismic Safety Reporting Act (Public Resources Code Section 26800-26805).  
 For information regarding the scope and recommended methods to be used in conducting the required data investigations, see DMC Special Publication 111 Guidelines for Evaluating and Mitigating Seismic Hazards in California.  
 For a general description of the Seismic Hazard Mapping Program, the National Earthquake Information Center, and regulations, see related information, please refer to the State Earthquake Hazard Mitigation Act (Public Resources Code Section 26800-26805).  
 Production of this map was funded by the Federal Emergency Management Agency's Hazard Mitigation Program and the Department of Conservation in cooperation with the Governor's Office of Emergency Services.

**IMPORTANT - PLEASE NOTE**  
 1. This map may not be used in areas that have the potential for liquefaction, landsliding, strong earthquake ground shaking or other earthquake and geologic hazards. When a significant hazard exists, the Department of Conservation will issue a warning to the public through the media.  
 2. Liquefaction zones may also contain areas susceptible to the effects of subsidence, induced landslides. This information is typically available in separate maps (see DMC Special Publication 111).  
 3. This map does not show specific hazard zones for areas, if any, that may exist in the area. Please refer to the latest official map of earthquake fault zones for the area and other notices that are required by the Seismic Safety Reporting Act (Public Resources Code Section 26800-26805) for more information on this subject and to obtain or analyze maps, see DMC Special Publication 111.  
 4. Landslide zones on this map were determined, in part, by adapting methods first developed by the U.S. Geological Survey (USGS). A new generation of landslide hazard maps being prepared by the USGS (2001 and 2002), in preparation uses an empirical approach to evaluate new methods to assess landslide hazard zones. Although portions of the new methodology may be incorporated in future update hazard zone maps, the experimental USGS maps should not be used as substitutes for these official earthquake hazard zone maps.  
 5. U.S. Geological Survey base map contours provide that 99 percent of cultural features are located within 10 feet of ground surface at the date of the map. The identification and location of liquefaction and earthquake-induced landslides zones are based on available data. However, the quality of data used in this map has been evaluated and has been deemed to be accurate as possible at this date.  
 6. Information on this map is as sufficient to serve as a substitute for the geologic and geotechnical site investigations required under Chapters 7.3 and 7.8 of Division 2 of the Public Resources Code.  
 7. DISCLAIMER: The State of California and the Department of Conservation make no representations or warranties regarding the accuracy of the data from which these maps were derived. Neither the State nor the Department shall be liable under any circumstances for any direct, indirect, special, incidental or consequential damages with respect to any claim by any user or any third party on account of using these maps or the use of this map.

STATE OF CALIFORNIA

 STATE GEOLOGIST

**MAP EXPLANATION**  
 Zones of Required Investigation:

- Liquefaction**  
 Areas where historic occurrence of liquefaction, or local geologic, geomorphological and groundwater conditions indicate a potential for permanent ground displacements such that mitigation as defined in Public Resources Code Section 26802C would be required.
- Earthquake-Induced Landslides**  
 Areas where previous occurrence of landslides, movement, or local topographic, geologic, geotechnical and subsurface water conditions indicate a potential for permanent ground displacements such that mitigation as defined in Public Resources Code Section 26802C would be required.

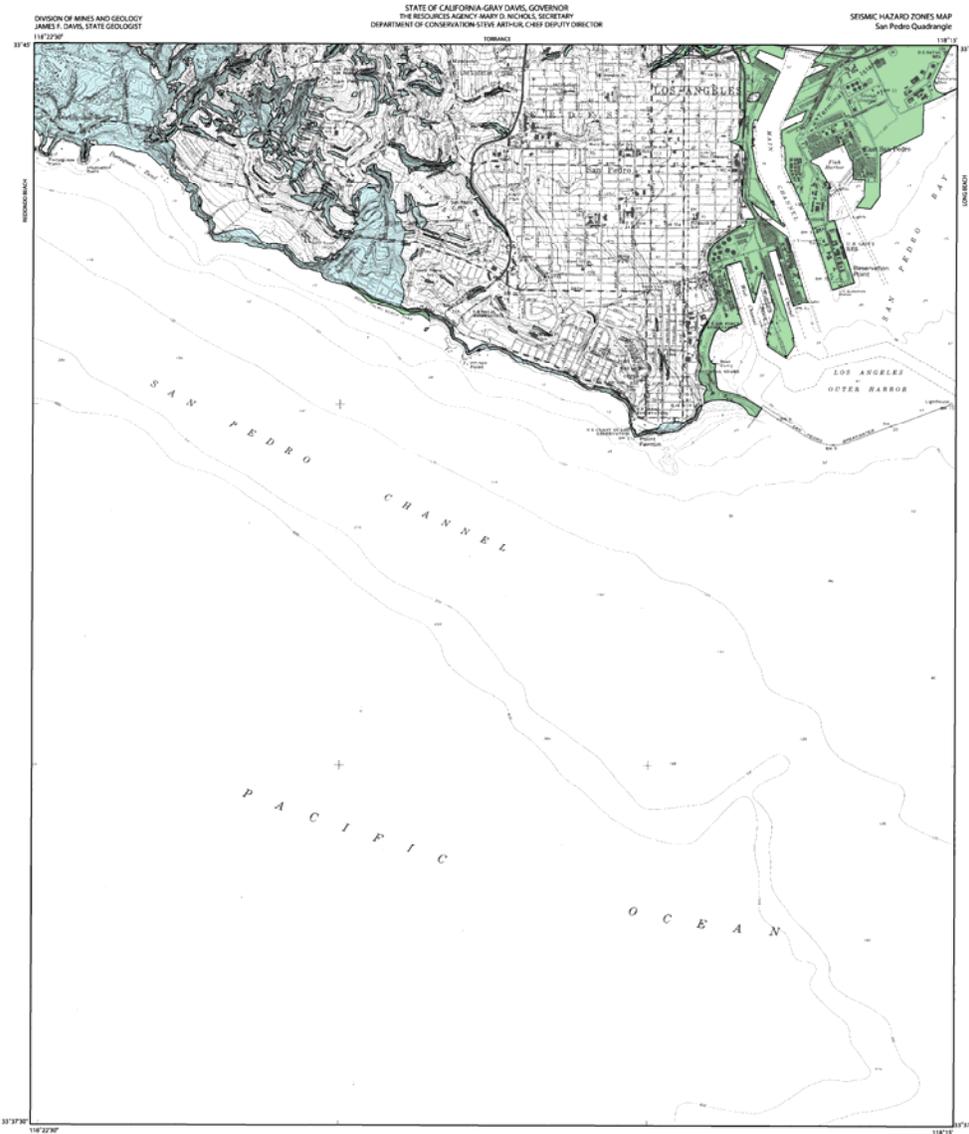

**DATA AND METHODOLOGY USED TO DEVELOP THIS MAP ARE PRESENTED IN THE FOLLOWING:**  
 Seismic Hazard Evaluation of the Redondo Beach 7.5-minute quadrangle, Los Angeles County, California, California Division of Mines and Geology, Open File Report 99-22.  
 For additional information on seismic hazards in this map area, the website used for listing and additional information is located, refer to DMC's World Wide Web site: <http://www.dmc.ca.gov/gis/>.

# Map 4-7: Seismic Hazard Zones – San Pedro Quadrangle (Source: State of California Department of Conservation)

**PURPOSE OF MAP**  
This map was prepared and issued in fulfillment of the responsibilities for protecting the public safety from the effects of earthquake triggered ground failure as required by the Seismic Hazard Mapping Act (Public Resources Code Section 26902-26904).

For information regarding the scope and recommended methods to be used in conducting the required site investigations, see DMC Special Publication 111, Guidelines for Evaluating and Mitigating Seismic Hazards in California.

For a general description of the Seismic Hazard Mapping Program, the Seismic Hazard Mapping Act and regulations, and related information, please refer to the Draft User's Guide (see <http://www.consrv.ca.gov/ehm/guide/>).

Production of this map was funded by the Federal Emergency Management Agency's Hazard Mitigation Program and the Department of Conservation in cooperation with the Governor's Office of Emergency Services.

**IMPORTANT - PLEASE NOTE**

- This map may not show all areas that have the potential for liquefaction, landsliding, strong earthquake ground shaking or other earthquake and seismic hazards. Also, a comprehensive database of existing structures or existing landslides will not uniformly affect the entire area shown.
- Liquefaction zones may also contain areas susceptible to the effects of earthquake-induced landslides. This situation typically arises in or near the low of existing landslides. Beware that the hazard areas for these areas, or adjacent to steep slopes, are not shown.
- This map does not show Active/Fault earthquake fault zones, if any, that may exist in this area. Please refer to the latest official map of earthquake fault zones for this County and other actions that are required by the Alquist-Pulido Earthquake Fault Zoning Act. For more information on this subject and an index to available maps, see DMC Special Publication 41.
- Landslide zones on this map were determined, in part, by mapping methods first developed by the U.S. Geological Survey (USGS). A new generation of landslide hazard maps being prepared by the USGS (Urban and Rural) in preparation for an experimental program designed to explore new methods to assess earthquake-induced landslides. Although methods of new technology may be incorporated in future hazard zone maps, the experimental USGS maps should not be used as substitutes for these official earthquake-induced landslide zone maps.
- U.S. Geological Survey maps normally provide that 95 percent of cultural features, including buildings, are shown with accuracy of 1:50,000. The identification and location of liquefaction and earthquake-induced landslide zones are based on available data; however, the quality of data used is varied. The zone boundaries depicted have been drawn as accurately as possible at this scale.
- Information on this map is not sufficient to serve as a substitute for the geologic and geotechnical site investigations required under Chapters 7 and 8 of Division 2 of the Public Resources Code.
- DISCLAIMER: The State of California and the Department of Conservation make no representation or warranty regarding the accuracy of the data from which these maps were derived. Neither the State nor the Department shall be liable under any circumstances for any direct, indirect, punitive or consequential damages with respect to any claims by any user or any third party on account of or arising from the use of this map.

**Map 4-8: Seismic Hazard Zones – Torrance Quadrangle**  
 (Source: State of California Department of Conservation)

**PURPOSE OF MAP**  
 The engineer and counties are liable for their responsibility for providing the public with accurate information regarding general information as required by the Seismic Hazard Mapping Act (Public Resources Code Sections 2690-2695.6).  
 For information regarding the scope and responsibilities of methods for land use planning the required investigations, see 2002 Special Publication U.S. Guidelines for Land-use and Mitigating Seismic Hazards in California.  
 For a general description of the Seismic Hazard Mapping Program, the Seismic Hazard Mapping Act and regulations, and related information, please refer to the State Seismic Hazard Mapping Program website (<http://www.conservation.ca.gov/seismic>).

**IMPORTANT - PLEASE NOTE**  
 1) This map does not show areas that have the potential for liquefaction, landsliding, strong motion ground shaking or other non-seismic and geologic hazards. Also, it does not show areas of seismicity, fault lines or significant earthquake faults and seismicity that affect the active area zone.  
 2) This map does not show areas that are subject to the effects of tsunamis, storm surge, or other hazards. This information is available at or near the top of existing landslide, tsunami, and other hazard maps. This information is not intended to be used as a substitute for any official and applicable regulatory or other maps.  
 3) This map does not show Active Flood Hazard areas, if any, that may exist in the area. Floodable areas are shown on the Flood Hazard and Floodable Areas and other related maps that are available for the Active Flood Hazard and Floodable Areas. For more information on this subject and for where to purchase maps, see DMG Special Publications #2.  
 4) Landfill areas on this map were determined, in part, by existing methods first developed by the U.S. Geological Survey (USGS). A new generation of seismic hazard mapping is currently being developed by the USGS. The USGS is currently using a new approach designed to explore new methods to assess earthquake-induced seismic hazards. Although aspects of the new methodology may be incorporated in future seismic hazard zone maps, the experimental USGS maps should not be used as a substitute for these official and applicable regulatory or other maps.  
 5) U.S. Geological Survey base maps normally provide that 80 percent of cultural features be shown relative to the National Accuracy of the base map. The identification and location of foundation and earthquake-induced seismic zones are based on available data. However, the quality of data used is varied. The zones shown on this map were drawn as accurately as possible on this scale.  
 6) Information on this map is not sufficient to serve as a substitute for the geologic and geotechnical site investigations required under Chapters 7.5 and 7.8 of Division 2 of the Public Resources Code.  
 7) DISCLAIMER: The State of California and the Department of Conservation make no representation or warranty regarding the data shown on this map. The data shown on this map were derived from the State and the Department shall be liable under any circumstances for any direct, indirect, special, incidental or consequential damages or losses to any claim by any user or any third party on account of or arising from the use of this map.

## Risk Analysis

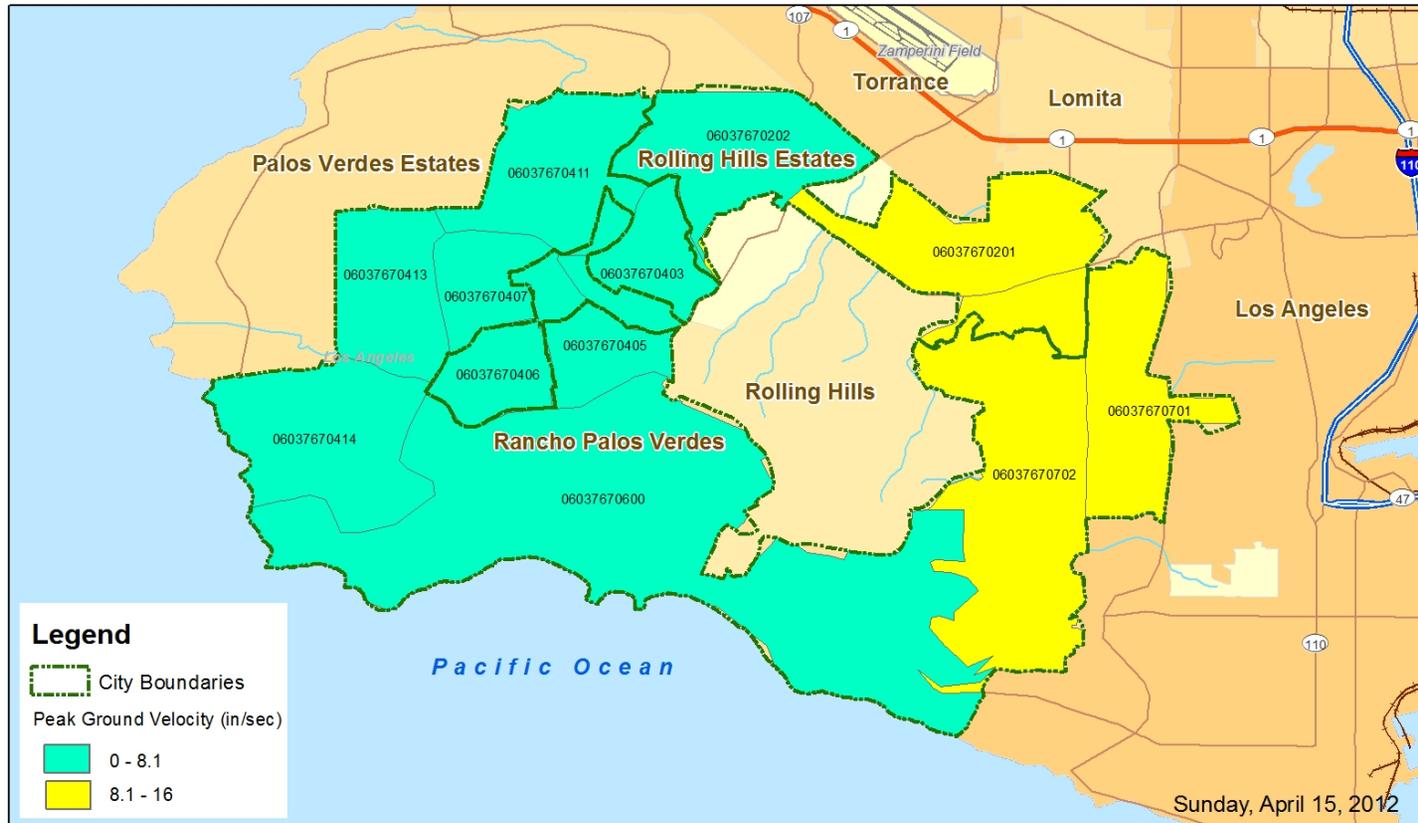

Risk analysis is the third phase of a hazard assessment. Risk analysis involves estimating the damage and costs likely to be experienced in a geographic area over a period of time. Factors included in assessing earthquake risk, include population and property distribution in the hazard area, the frequency of earthquake events, landslide susceptibility, buildings, infrastructure, and disaster preparedness of the region. This type of analysis generates estimates of the damages to the planning area due to an earthquake event in a specific location. FEMA's software program, HAZUS, uses mathematical formulas and information about building stock, local geology and the location and size of potential earthquakes, economic data, and other information, to estimate losses from a potential earthquake.

HAZUS software was used in the Plan update to analyze two earthquake scenarios: Newport-Inglewood and Palos Verdes Fault. The HAZUS maps and reports begin on the next page.

## General Description of the Region

Hazus is a regional earthquake loss estimation model that was developed by the Federal Emergency Management Agency and the National Institute of Building Sciences. The primary purpose of Hazus is to provide a methodology and software application to develop earthquake losses at a regional scale. These loss estimates would be used primarily by local, state and regional officials to plan and stimulate efforts to reduce risks from earthquakes and to prepare for emergency response and recovery.

The earthquake loss estimates provided in this report was based on a region that includes 1 county(ies) from the following state(s):

California

Note:

Appendix A contains a complete listing of the counties contained in the region.

The geographical size of the region is 17.97 square miles and contains 12 census tracts. There are over 19 thousand households in the region which has a total population of 51,341 people (2002 Census Bureau data). The distribution of population by State and County is provided in Appendix B.

There are an estimated 18 thousand buildings in the region with a total building replacement value (excluding contents) of 5,630 (millions of dollars). Approximately 94.00 % of the buildings (and 90.00% of the building value) are associated with residential housing.

The replacement value of the transportation and utility lifeline systems is estimated to be 302 and 0 (millions of dollars) , respectively.

## Building and Lifeline Inventory

### **Building Inventory**

Hazus estimates that there are 18 thousand buildings in the region which have an aggregate total replacement value of 5,630 (millions of dollars) . Appendix B provides a general distribution of the building value by State and County.

In terms of building construction types found in the region, wood frame construction makes up 94% of the building inventory. The remaining percentage is distributed between the other general building types.

### **Critical Facility Inventory**

Hazus breaks critical facilities into two (2) groups: essential facilities and high potential loss facilities (HPL). Essential facilities include hospitals, medical clinics, schools, fire stations, police stations and emergency operations facilities. High potential loss facilities include dams, levees, military installations, nuclear power plants and hazardous material sites.

For essential facilities, there are 0 hospitals in the region with a total bed capacity of 0 beds. There are 22 schools, 0 fire stations, 0 police stations and 0 emergency operation facilities. With respect to high potential loss facilities (HPL), there are 1 dams identified within the region. Of these, 1 of the dams are classified as 'high hazard'. The inventory also includes 1 hazardous material sites, 0 military installations and 0 nuclear power plants.

### **Transportation and Utility Lifeline Inventory**

Within Hazus, the lifeline inventory is divided between transportation and utility lifeline systems. There are seven (7) transportation systems that include highways, railways, light rail, bus, ports, ferry and airports. There are six (6) utility systems that include potable water, wastewater, natural gas, crude & refined oil, electric power and communications. The lifeline inventory data are provided in Tables 1 and 2.

The total value of the lifeline inventory is over 302.00 (millions of dollars). This inventory includes over 45 kilometers of highways, 0 bridges, 645 kilometers of pipes.

**Table 1: Transportation System Lifeline Inventory**

| System            | Component       | # Locations/<br># Segments | Replacement value<br>(millions of dollars) |
|-------------------|-----------------|----------------------------|--|
| <b>Highway</b>    | Bridges         | 0                          | 0.00                                       |

## Earthquake Scenario

Hazus uses the following set of information to define the earthquake parameters used for the earthquake loss estimate provided in this report.

|                                      |   |
|--------------------------------------|---|

## Building Damage

### Building Damage

Hazus estimates that about 850 buildings will be at least moderately damaged. This is over 5.00 % of the buildings in the region. There are an estimated 9 buildings that will be damaged beyond repair. The definition of the 'damage states' is provided in Volume 1: Chapter 5 of the Hazus technical manual. Table 3 below summarizes the expected damage by general occupancy for the buildings in the region. Table 4 below summarizes the expected damage by general building type.

Table 3: Expected Building Damage by Occupancy

### **Essential Facility Damage**

Before the earthquake, the region had 0 hospital beds available for use. On the day of the earthquake, the model estimates that only 0 hospital beds (0.00%) are available for use by patients already in the hospital and those injured by the earthquake. After one week, 0.00% of the beds will be back in service. By 30 days, 0.00% will be operational.

**Table 5: Expected Damage to Essential Facilities**

| Classification | Total | # Facilities                      |                          |                                      |

|            | Facilities | 0                      | 0                            | 0                       | 0                         | 0           |
| Light Rail | Segments   | 0                      | 0                            | 0                       | 0                         | 0           |
|            | Bridges    | 0                      | 0                            | 0                       | 0                         | 0           |
|            | Tunnels    | 0                      | 0                            | 0                       | 0                         | 0           |
|            | Facilities | 0                      | 0                            | 0                       | 0                         | 0           |
| Bus        | Facilities | 0                      | 0                            | 0                       | 0                         | 0           |
| Ferry      | Facilities | 0                      | 0                            | 0                       | 0                         | 0           |
| Port       | Facilities | 0                      | 0                            | 0                       | 0                         | 0           |
| Airport    | Facilities | 0                      | 0                            | 0                       | 0                         | 0           |
|            | Runways    | 0                      | 0                            | 0                       | 0                         | 0           |

Note: Roadway segments, railroad tracks and light rail tracks are assumed to be damaged by ground failure only. If ground failure maps are not provided, damage estimates to these components will not be computed.

Tables 7-9 provide information on the damage to the utility lifeline systems. Table 7 provides damage to the utility system facilities. Table 8 provides estimates on the number of leaks and breaks by the pipelines of the utility systems. For electric power and potable water, Hazus performs a simplified system performance analysis. Table 9 provides a summary of the system performance information.

Table 7 : Expected Utility System Facility Damage

| System           | # of Locations |                               |                      |                           |             |
|------------------|----------------|-------------------------------|----------------------|---------------------------|-------------|
|                  | Total #        | With at Least Moderate Damage | With Complete Damage | with Functionality > 50 % |             |
|                  |                |                               |                      | After Day 1               | After Day 7 |
| Potable Water    | 0              | 0                             | 0                    | 0                         | 0           |

| Electrical Power | 0              | 0                             | 0                    | 0                         | 0           |
| Communication    | 0              | 0                             | 0                    | 0                         | 0           |

Table 8 : Expected Utility System Pipeline Damage (Site Specific)

| System        | Total Pipelines Length (kms) | Number of Leaks | Number of Breaks |
|---------------|------------------------------|-----------------|------------------|
| Potable Water | 323                          | 19              | 5                |
| Waste Water   | 194                          | 9               | 2                |
| Natural Gas   | 129                          | 3               | 1                |
| Oil           | 0                            | 0               | 0                |

Table 9: Expected Potable Water and Electric Power System Performance

|                | Total # of Households | Number of Households without Service |          |          |           |           |
|----------------|-----------------------|--------------------------------------|----------|----------|-----------|-----------|
|                |                       | At Day 1                             | At Day 3 | At Day 7 | At Day 30 | At Day 90 |
| Potable Water  | 19,121                | 0                                    | 0        | 0        | 0         | 0         |
| Electric Power |                       | 0                                    | 0        | 0        | 0         | 0         |

## Induced Earthquake Damage

### **Fire Following Earthquake**

Fires often occur after an earthquake. Because of the number of fires and the lack of water to fight the fires, they can often burn out of control. Hazus uses a Monte Carlo simulation model to estimate the number of ignitions and the amount of burnt area. For this scenario, the model estimates that there will be 0 ignitions that will burn about 0.00 sq. mi (0.00 % of the region's total area.) The model also estimates that the fires will displace about 0 people and burn about 0 (millions of dollars) of building value.

### **Debris Generation**

Hazus estimates the amount of debris that will be generated by the earthquake. The model breaks the debris into two general categories: a) Brick/Wood and b) Reinforced Concrete/Steel. This distinction is made because of the different types of material handling equipment required to handle the debris.

The model estimates that a total of 0.02 million tons of debris will be generated. Of the total amount, Brick/Wood comprises 50.00% of the total, with the remainder being Reinforced Concrete/Steel. If the debris tonnage is converted to an estimated number of truckloads, it will require 640 truckloads (@25 tons/truck) to remove the debris generated by the earthquake.

## Social Impact

### Shelter Requirement

Hazus estimates the number of households that are expected to be displaced from their homes due to the earthquake and the number of displaced people that will require accommodations in temporary public shelters. The model estimates 27 households to be displaced due to the earthquake. Of these, 14 people (out of a total population of 51,341) will seek temporary shelter in public shelters.

### Casualties

Hazus estimates the number of people that will be injured and killed by the earthquake. The casualties are broken down into four (4) severity levels that describe the extent of the injuries. The levels are described as follows;

- Severity Level 1: Injuries will require medical attention but hospitalization is not needed.
- Severity Level 2: Injuries will require hospitalization but are not considered life-threatening
- Severity Level 3: Injuries will require hospitalization and can become life threatening if not promptly treated.
- Severity Level 4: Victims are killed by the earthquake.

The casualty estimates are provided for three (3) times of day: 2:00 AM, 2:00 PM and 5:00 PM. These times represent the periods of the day that different sectors of the community are at their peak occupancy loads. The 2:00 AM estimate considers that the residential occupancy load is maximum, the 2:00 PM estimate considers that the educational, commercial and industrial sector loads are maximum and 5:00 PM represents peak commute time.

Table 10 provides a summary of the casualties estimated for this earthquake

Table 10: Casualty Estimates

|                   |                   | Level 1    | Level 2  | Level 3  | Level 4  |
|-------------------|-------------------|------------|----------|----------|----------|
| <b>2 AM</b>       | Commercial        | 0          | 0        | 0        | 0        |
|                   | Commuting         | 0          | 0        | 0        | 0        |
|                   | Educational       | 0          | 0        | 0        | 0        |
|                   | Hotels            | 0          | 0        | 0        | 0        |
|                   | Industrial        | 0          | 0        | 0        | 0        |

|                   | <b>Total</b>      | <b>14</b>  | <b>2</b> | <b>0</b> | <b>0</b> |

## Economic Loss

The total economic loss estimated for the earthquake is 123.12 (millions of dollars), which includes building and lifeline related losses based on the region's available inventory. The following three sections provide more detailed information about these losses.

### Building-Related Losses

The building losses are broken into two categories: direct building losses and business interruption losses. The direct building losses are the estimated costs to repair or replace the damage caused to the building and its contents. The business interruption losses are the losses associated with inability to operate a business because of the damage sustained during the earthquake. Business interruption losses also include the temporary living expenses for those people displaced from their homes because of the earthquake.

The total building-related losses were 122.98 (millions of dollars); 11 % of the estimated losses were related to the business interruption of the region. By far, the largest loss was sustained by the residential occupancies which made up over 78 % of the total loss. Table 11 below provides a summary of the losses associated with the building damage.

**Table 11: Building-Related Economic Loss Estimates**  
(Millions of dollars)

| Category                    | Area            | Single Family | Other Residential | Commercial   | Industrial  | Others      | Total         |

**Transportation and Utility Lifeline Losses**

For the transportation and utility lifeline systems, Hazus computes the direct repair cost for each component only. There are no losses computed by Hazus for business interruption due to lifeline outages. Tables 12 & 13 provide a detailed breakdown in the expected lifeline losses.

Hazus estimates the long-term economic impacts to the region for 15 years after the earthquake. The model quantifies this information in terms of income and employment changes within the region. Table 14 presents the results of the region for the given earthquake.

## Hazus-MH: Earthquake Event Report

---

**Region Name:** RPVRHETracts  
**Earthquake Scenario:** PalosVerdesM7.1  
**Print Date:** April 15, 2012

*Totals only reflect data for those census tracts/blocks included in the user's study region.*

**Disclaimer:**

*The estimates of social and economic impacts contained in this report were produced using Hazus loss estimation methodology software which is based on current scientific and engineering knowledge. There are uncertainties inherent in any loss estimation technique. Therefore, there may be significant differences between the modeled results contained in this report and the actual social and economic losses following a specific earthquake. These results can be improved by using enhanced inventory, geotechnical, and observed ground motion data.*

## General Description of the Region

Hazus is a regional earthquake loss estimation model that was developed by the Federal Emergency Management Agency and the National Institute of Building Sciences. The primary purpose of Hazus is to provide a methodology and software application to develop earthquake losses at a regional scale. These loss estimates would be used primarily by local, state and regional officials to plan and stimulate efforts to reduce risks from earthquakes and to prepare for emergency response and recovery.

The earthquake loss estimates provided in this report was based on a region that includes 1 county(ies) from the following state(s):

California

Note:

Appendix A contains a complete listing of the counties contained in the region.

The geographical size of the region is 17.97 square miles and contains 12 census tracts. There are over 19 thousand households in the region which has a total population of 51,341 people (2002 Census Bureau data). The distribution of population by State and County is provided in Appendix B.

There are an estimated 18 thousand buildings in the region with a total building replacement value (excluding contents) of 5,630 (millions of dollars). Approximately 94.00 % of the buildings (and 90.00% of the building value) are associated with residential housing.

The replacement value of the transportation and utility lifeline systems is estimated to be 302 and 0 (millions of dollars) , respectively.

## Building and Lifeline Inventory

### **Building Inventory**

Hazus estimates that there are 18 thousand buildings in the region which have an aggregate total replacement value of 5,630 (millions of dollars) . Appendix B provides a general distribution of the building value by State and County.

In terms of building construction types found in the region, wood frame construction makes up 94% of the building inventory. The remaining percentage is distributed between the other general building types.

### **Critical Facility Inventory**

Hazus breaks critical facilities into two (2) groups: essential facilities and high potential loss facilities (HPL). Essential facilities include hospitals, medical clinics, schools, fire stations, police stations and emergency operations facilities. High potential loss facilities include dams, levees, military installations, nuclear power plants and hazardous material sites.

For essential facilities, there are 0 hospitals in the region with a total bed capacity of 0 beds. There are 22 schools, 0 fire stations, 0 police stations and 0 emergency operation facilities. With respect to high potential loss facilities (HPL), there are 1 dams identified within the region. Of these, 1 of the dams are classified as 'high hazard'. The inventory also includes 1 hazardous material sites, 0 military installations and 0 nuclear power plants.

### **Transportation and Utility Lifeline Inventory**

Within Hazus, the lifeline inventory is divided between transportation and utility lifeline systems. There are seven (7) transportation systems that include highways, railways, light rail, bus, ports, ferry and airports. There are six (6) utility systems that include potable water, wastewater, natural gas, crude & refined oil, electric power and communications. The lifeline inventory data are provided in Tables 1 and 2.

The total value of the lifeline inventory is over 302.00 (millions of dollars). This inventory includes over 45 kilometers of highways, 0 bridges, 645 kilometers of pipes.

**Table 1: Transportation System Lifeline Inventory**

| System            | Component       | # Locations/<br># Segments | Replacement value<br>(millions of dollars) |
|-------------------|-----------------|----------------------------|--|

## Earthquake Scenario

Hazus uses the following set of information to define the earthquake parameters used for the earthquake loss estimate provided in this report.

|                                      |   |
|--------------------------------------|---|
| <b>Scenario Name</b>                 | PalosVerdesM7.1                         |
| <b>Type of Earthquake</b>            | Arbitrary                               |
| <b>Fault Name</b>                    | NA                                      |
| <b>Historical Epicenter ID #</b>     | NA                                      |

## Building Damage

### Building Damage

Hazus estimates that about 3,531 buildings will be at least moderately damaged. This is over 19.00 % of the buildings in the region. There are an estimated 131 buildings that will be damaged beyond repair. The definition of the 'damage states' is provided in Volume 1: Chapter 5 of the Hazus technical manual. Table 3 below summarizes the expected damage by general occupancy for the buildings in the region. Table 4 below summarizes the expected damage by general building type.

Table 3: Expected Building Damage by Occupancy

|                   | None         |       | Slight       |       | Moderate     |       | Extensive  |       | Complete   |       |

### **Essential Facility Damage**

Before the earthquake, the region had 0 hospital beds available for use. On the day of the earthquake, the model estimates that only 0 hospital beds (0.00%) are available for use by patients already in the hospital and those injured by the earthquake. After one week, 0.00% of the beds will be back in service. By 30 days, 0.00% will be operational.

**Table 5: Expected Damage to Essential Facilities**

| Classification | Total | # Facilities                      |                          |                                      |

|            | Runways    | 0                      | 0                            | 0                       | 0                         | 0           |

Note: Roadway segments, railroad tracks and light rail tracks are assumed to be damaged by ground failure only. If ground failure maps are not provided, damage estimates to these components will not be computed.

Tables 7-9 provide information on the damage to the utility lifeline systems. Table 7 provides damage to the utility system facilities. Table 8 provides estimates on the number of leaks and breaks by the pipelines of the utility systems. For electric power and potable water, Hazus performs a simplified system performance analysis. Table 9 provides a summary of the system performance information.

Table 7 : Expected Utility System Facility Damage

| System           | # of Locations |                               |                      |                           |             |

| Potable Water  | 19,121                | 0                                    | 0        | 0        | 0         | 0         |
| Electric Power |                       | 3,004                                | 1,708    | 616      | 106       | 5         |

## Induced Earthquake Damage

### **Fire Following Earthquake**

Fires often occur after an earthquake. Because of the number of fires and the lack of water to fight the fires, they can often burn out of control. Hazus uses a Monte Carlo simulation model to estimate the number of ignitions and the amount of burnt area. For this scenario, the model estimates that there will be 0 ignitions that will burn about 0.00 sq. mi (0.00 % of the region's total area.) The model also estimates that the fires will displace about 0 people and burn about 0 (millions of dollars) of building value.

### **Debris Generation**

Hazus estimates the amount of debris that will be generated by the earthquake. The model breaks the debris into two general categories: a) Brick/Wood and b) Reinforced Concrete/Steel. This distinction is made because of the different types of material handling equipment required to handle the debris.

The model estimates that a total of 0.08 million tons of debris will be generated. Of the total amount, Brick/Wood comprises 43.00% of the total, with the remainder being Reinforced Concrete/Steel. If the debris tonnage is converted to an estimated number of truckloads, it will require 3,160 truckloads (@25 tons/truck) to remove the debris generated by the earthquake.

## Social Impact

### Shelter Requirement

Hazus estimates the number of households that are expected to be displaced from their homes due to the earthquake and the number of displaced people that will require accommodations in temporary public shelters. The model estimates 212 households to be displaced due to the earthquake. Of these, 109 people (out of a total population of 51,341) will seek temporary shelter in public shelters.

### Casualties

Hazus estimates the number of people that will be injured and killed by the earthquake. The casualties are broken down into four (4) severity levels that describe the extent of the injuries. The levels are described as follows;

- Severity Level 1: Injuries will require medical attention but hospitalization is not needed.
- Severity Level 2: Injuries will require hospitalization but are not considered life-threatening
- Severity Level 3: Injuries will require hospitalization and can become life threatening if not promptly treated.
- Severity Level 4: Victims are killed by the earthquake.

The casualty estimates are provided for three (3) times of day: 2:00 AM, 2:00 PM and 5:00 PM. These times represent the periods of the day that different sectors of the community are at their peak occupancy loads. The 2:00 AM estimate considers that the residential occupancy load is maximum, the 2:00 PM estimate considers that the educational, commercial and industrial sector loads are maximum and 5:00 PM represents peak commute time.

Table 10 provides a summary of the casualties estimated for this earthquake

Table 10: Casualty Estimates

|                   |                   | Level 1    | Level 2   | Level 3  | Level 4  |

## Economic Loss

The total economic loss estimated for the earthquake is 475.43 (millions of dollars), which includes building and lifeline related losses based on the region's available inventory. The following three sections provide more detailed information about these losses.

### Building-Related Losses

The building losses are broken into two categories: direct building losses and business interruption losses. The direct building losses are the estimated costs to repair or replace the damage caused to the building and its contents. The business interruption losses are the losses associated with inability to operate a business because of the damage sustained during the earthquake. Business interruption losses also include the temporary living expenses for those people displaced from their homes because of the earthquake.

The total building-related losses were 474.68 (millions of dollars); 13 % of the estimated losses were related to the business interruption of the region. By far, the largest loss was sustained by the residential occupancies which made up over 76 % of the total loss. Table 11 below provides a summary of the losses associated with the building damage.

**Table 11: Building-Related Economic Loss Estimates**  
(Millions of dollars)

| Category                    | Area            | Single Family | Other Residential | Commercial   | Industrial  | Others       | Total         |
|-----------------------------|-----------------|---------------|-------------------|--------------|-------------|--------------|---------------|

**Transportation and Utility Lifeline Losses**

For the transportation and utility lifeline systems, Hazus computes the direct repair cost for each component only. There are no losses computed by Hazus for business interruption due to lifeline outages. Tables 12 & 13 provide a detailed breakdown in the expected lifeline losses.

Hazus estimates the long-term economic impacts to the region for 15 years after the earthquake. The model quantifies this information in terms of income and employment changes within the region. Table 14 presents the results of the region for the given earthquake.

## Community Earthquake Issues

### *What is Susceptible to Earthquakes?*

Earthquake damage occurs because humans have built structures that cannot withstand severe shaking. Buildings, airports, schools, and lifelines (highways and utility lines) suffer damage in earthquakes and can cause death or injury to humans. The welfare of homes, major businesses, and public infrastructure is very important. Addressing the reliability of buildings, critical facilities, and infrastructure, and understanding the potential costs to government, businesses, and individuals as a result of an earthquake, are challenges faced by the Cities.

### *Dams*

There are a total of 103 dams in Los Angeles County, owned by 23 agencies or organizations, ranging from the Federal government to Home Owner Associations. These dams hold billions of gallons of water in reservoirs. Releases of water from the major reservoirs are designed to protect Southern California from flood waters and to store domestic water. Seismic activity can compromise the dam structures, and the resultant flooding could cause catastrophic flooding. Following the 1971 Sylmar Earthquake the Lower Van Norman Dam showed signs of structural compromise, and tens of thousands of persons had to be evacuated until the dam could be drained. The dam has never been refilled.

Because of the current design and construction practices and ongoing programs of review and modification, catastrophic dam failure is considered unlikely. However, it is expected that many flood control channels could suffer damage. Also, pumping stations in coastal communities are expected to fail due to liquefaction.

The Metropolitan Water District of Southern California owns and maintains the Palos Verdes Reservoir, located at the southeast corner of Palos Verdes Drive East and Palos Verdes Drive North. Although not a dam by definition, the reservoir poses a similar threat as a “dam”. The reservoir is constructed of steel reinforced concrete with earth-fill reinforcement banked around the perimeter and lined with an impervious rubber liner. It has an approximate capacity of 1,000 acre feet. A ravine leads from the west spill gate to an underground flood control channel following the natural terrain to the east through Green Hills Memorial Park. The Memorial Park is bordered by residential areas.

According to the RPV MHFP, the most populated residential streets affected by a sudden dam failure could be the following residential streets: Avenida Feliciano, Tarrassa, Alvesta, Bandra, Avenida Del Mesa, and Redondela. Western Avenue might be affected between John Montgomery Drive and Avenida Aprenda.

The RHE General Plan Safety Element states that dam failure is not a severe safety threat to the City of Rolling Hills Estates because only open space and a parking lot are in the inundation path.

Map 4-11: Palos Verdes Reservoir Inundation Area  
 (Source: Rolling Hills Estates General Plan)

## *Buildings*

The built environment is susceptible to damage from earthquakes. Buildings that collapse can trap and bury people. Lives are at risk, and the cost to clean up the damages is great. In most California communities, including the planning area, some buildings were built before 1933 when building codes were not as strict. In addition, retrofitting is not required except under certain conditions and can be expensive. Therefore, the number of buildings at risk remains high. The California Seismic Safety Commission makes annual reports on the progress of the retrofitting of unreinforced masonry buildings. Fortunately, there are very few buildings in the planning area that were constructed prior to 1933. The bulk of development that has occurred in both Cities took place after World War II.

Because the planning area is comprised primarily of low and medium residential dwellings, it is anticipated that most dwellings would not suffer severe structural damage unless they are in an area of instable soil. However, the combination of severity and length of the shaking could still produce dramatic effects.

## *Infrastructure and Communication*

Residents in the planning area commute frequently by automobiles and public transportation such as buses. An earthquake can greatly damage bridges and roads, hampering emergency response efforts and the normal movement of people and goods. Damaged infrastructure strongly affects the economy of the community because it disconnects people from work, school, food, and leisure, and separates businesses from their customers and suppliers.

## *Bridge Damage*

Even modern bridges can sustain damage during earthquakes, leaving them unsafe for use. Some bridges have failed completely due to strong ground motion. Bridges are a vital transportation link - with even minor damages, making some areas inaccessible. Because bridges vary in size, materials, location and design, any given earthquake will affect them differently. Bridges built before the mid-1970' s have a significantly higher risk of suffering structural damage during a moderate to large earthquake compared with those built after 1980 when design improvements were made.

There are no bridges located within the planning area. However, there are several bridges that provide access to the planning area which are state, county or privately owned (including railroad bridges). Much of the interstate highway system was built in the mid to late 1960's. California Department of Transportation (Caltrans) has retrofitted most bridges on the freeway systems; however there are still some county maintained bridges that are not retrofitted. The FHWA requires that bridges on the National Bridge Inventory be inspected every 2 years. Caltrans checks when the bridges are inspected because they administer the Federal funds for bridge projects.

## *Damage to Lifelines*

Lifelines are the connections between communities and outside services. They include water and gas lines, transportation systems, and electricity and communication networks. Ground shaking and amplification can cause pipes to break open, power lines to fall, roads and railways to crack or move, and radio and telephone communication to cease. Disruption to transportation makes it especially difficult to bring in supplies or services. Lifelines need to be

usable after earthquake to allow for rescue, recovery, and rebuilding efforts and to relay important information to the public.

### *Disruption of Critical Services*

Critical facilities include police stations, fire stations, hospitals, shelters, and other facilities that provide important services to the community. According to the MHFP’s for the planning area cities, severe shortages are projected for hospital beds, communications systems, electrical power, fire resources, natural gas, petroleum fuels, railroad services, sanitation systems, and water supply. These facilities and their services need to be functional after an earthquake event.

### *Businesses*

Seismic activity can cause great loss to businesses, both large-scale corporations and small retail shops. When a company is forced to stop production for just a day, the economic loss can be tremendous, especially when its market is at a national or global level. Seismic activity can create economic loss that presents a burden to large and small shop owners who may have difficulty recovering from their losses.

Forty percent of businesses do not reopen after a disaster, and another twenty-five percent fail within one year, according to FEMA. Similar statistics from the United States Small Business Administration indicate that over ninety percent of businesses fail within two years after being struck by a disaster.

---

Of all businesses which close following a natural disaster, more than forty-three percent never reopen, and an additional twenty-nine percent close for good within the next two years.

---

### *Individual Preparedness*

Because the potential for earthquake occurrences, and earthquake related property damage, is relatively high in Los Angeles County, increasing individual preparedness is a significant need. Strapping down heavy furniture, water heaters, and expensive personal property, as well as being earthquake-insured, and anchoring buildings to foundations, are just a few steps individuals can take to prepare for an earthquake.

### *Death and Injury*

Death and injury can occur both inside and outside of buildings due to collapsed buildings, falling equipment, furniture, debris, and structural materials. Downed power lines and broken water and gas lines can also endanger human life.

### *Fire*

Downed power lines or broken gas mains can trigger fires. When fire stations suffer building or lifeline damage, quick response to extinguish fires is less likely. Furthermore, major incidents demand a larger share of resources, and initially smaller fires and problems receive little or insufficient resources in the initial hours after a major earthquake event.

Loss of electricity may cause a loss of water pressure in some communities, further hampering firefighting ability.

### *Debris*

After damage to a variety of structures, much time is spent cleaning up brick, glass, wood, steel or concrete building elements, office and home contents, and other materials. Developing a strong debris management strategy is essential in post-disaster recovery. Disasters do not exempt the Cities in the planning area from compliance with the state's AB 939 solid waste reduction regulations.

### *Existing Mitigation Activities*

Existing mitigation activities include current mitigation programs and activities that are implemented by county, regional, state, or federal agencies or organizations.

### *City Codes*

Implementation of earthquake mitigation policy most often takes place at the local government level. The City Building and Safety Departments enforce the following Uniform Building Codes pertaining to earthquake hazards:

- 1605.2.1 (Distribution of Horizontal Shear)
- 1605.2.2 (Stability against Overturning)
- 1626-1629 (Seismic)
- 1605.2.3 (Anchorage)

Both Cities have Planning Departments that enforce the zoning and land use regulations relating to earthquake hazards.

Generally, these codes seek to discourage development in areas that could be prone to flooding, landslide, wildfire and/or seismic hazards; and where development is permitted, that the applicable construction standards are met. Developers in hazard-prone areas may be required to retain a qualified professional engineer to evaluate level of risk on the site and recommend appropriate mitigation measures.

### *Coordination among Building Officials*

The City Building Codes set the minimum design and construction standards for new buildings. In 2002 the City of Rancho Palos Verdes and the City of Rolling Hills Estates adopted the most recent seismic standards in its building code, which requires that new and remodeled buildings be built at a higher seismic standard.

Since November 8, 1987, the Cities have also required that site-specific seismic hazard investigations be performed for new essential facilities, major structures, hazardous facilities, and special occupancy structures such as schools, hospitals, and emergency response facilities.

### *Identify the Applicable Code Sections that Apply to Earthquake Hazard Mitigation*

Generally, these codes seek to discourage development in areas that could be prone to flooding, landslide, wildfire and/or seismic hazards; and where development is permitted, that the applicable construction standards are met. Developers in hazard-prone areas may be required to retain a qualified professional engineer to evaluate level of risk on the site and recommend appropriate mitigation measures.

### *Businesses/Private Sector*

Hazards have a devastating impact on businesses. In fact, of all businesses that close, following a disaster, forty percent never reopen, and an additional twenty-nine percent close for good within the next two years. The Institute of Business and Home Safety has developed “Open for Business,” a disaster planning tool kit that helps guide businesses in preparing for, and dealing with, the adverse effects of hazards. The kit integrates protection from disasters into the company's risk reduction measures to safeguard employees, customers, and the investment itself. The guide helps businesses secure human and physical resources during disasters, and helps to develop strategies to maintain business continuity before, during, and after a disaster occurs.

### *Hospitals*

“The Alfred E. Alquist Hospital Seismic Safety Act” (“Hospital Act”) was enacted in 1973 in response to the moderate M6.6 Sylmar Earthquake in 1971 when four major hospital campuses were severely damaged and evacuated. Two hospital buildings collapsed killing forty-seven people. Three others were killed in another hospital that nearly collapsed.

In approving the Act, the Legislature noted that:

“Hospitals, that house patients who have less than the capacity of normally healthy persons to protect themselves, and that must be reasonably capable of providing services to the public after a disaster, shall be designed and constructed to resist, insofar as practical, the forces generated by earthquakes, gravity and winds.” (Health and Safety Code Section 129680)

When the Hospital Act was passed in 1973, the State anticipated that, based on the regular and timely replacement of aging hospital facilities, the majority of hospital buildings would be in compliance with the Act's standards within 25 years. However, hospital buildings were not, and are not, being replaced at that anticipated rate. In fact, the great majority of the State's urgent care facilities are now more than 40 years old.

The moderate M6.7 Northridge Earthquake in 1994, caused \$3 billion in hospital-related damage and evacuations. Twelve hospital buildings constructed before the Act were cited (red tagged) as unsafe for occupancy after the earthquake. Those hospitals that were built in accordance with the 1973 Hospital Act were very successful in resisting structural damage. However, nonstructural damage (for example, plumbing and ceiling systems) was extensive in those post-1973 buildings. Senate Bill 1953 (SB 1953), enacted in 1994 after the Northridge Earthquake, expanded the scope of the 1973 Hospital Act. Under SB 1953, all hospitals are required, as of January 1, 2008, to survive earthquakes without collapsing or posing the threat of significant loss of life. The 1994 Act further mandates that all existing hospitals be seismically evaluated, and retrofitted, if needed, by 2030, so that they are in substantial compliance with the Act (which requires that the hospital buildings be reasonably capable of providing services to

the public after disasters). SB 1953 applies to all urgent care facilities (including those built prior to the 1973 Hospital Act) and affects approximately 2,500 buildings on 475 campuses.

SB 1953 directed the Office of Statewide Health Planning and Development (“OSHPD”), in consultation with the Hospital Building Safety Board, to develop emergency regulations including “...earthquake performance categories with sub gradations for risk to life, structural soundness, building contents, and nonstructural systems that are critical to providing basic services to hospital inpatients and the public after a disaster.” (Health and Safety Code Section 130005)

### *The Seismic Safety Commission Evaluation of the State’s Hospital Seismic Safety Policies*

In 2001, recognizing the continuing need to assess the adequacy of policies, and the application of advances in technical knowledge and understanding, the California Seismic Safety Commission created an Ad Hoc Committee to re-examine the compliance with the Alquist Hospital Seismic Safety Act. The formation of the Committee was also prompted by the recent evaluations of hospital buildings reported to OSHPD that revealed that a large percentage (40%) of California’s operating hospitals are in the highest category of collapse risk.

### *California Earthquake Mitigation Legislation*

California is painfully aware of the threats it faces from earthquakes. Dating back to the 19th century, Californians have been killed, injured, and lost property as a result of earthquakes. As the State’s population continues to grow, and urban areas become even denser, the risk will continue to increase. For decades the Legislature has passed laws to strengthen the built environment and protect the residents.

### *Earthquake Education*

Earthquake research and education activities are conducted at several major universities in the Southern California region, including Cal Tech, USC, UCLA, UCI, and UCSB. The local clearinghouse for earthquake information is the Southern California Earthquake Center (SCEC) located at the University of Southern California, Los Angeles, CA 90089, Telephone: (213) 740-5843, Fax: (213) 740-0011, Email: [SCEinfo@usc.edu](mailto:SCEinfo@usc.edu), Website: <http://www.scec.org>. SCEC is a community of scientists and specialists who actively coordinate research on earthquake hazards at nine core institutions, and communicate earthquake information to the public. SCEC is a National Science Foundation (NSF) Science and Technology Center and is co-funded by the United States Geological Survey (USGS).

## Section 5: Wildfire Hazards

| Calculated Priority Risk Index (CPRI) |                    |
|---------------------------------------|--------------------|
| Probability:                          | Likely             |
| Magnitude/Severity:                   | Critical           |
| Warning Time:                         | Less than 6 hours  |
| Duration:                             | Less than one week |

### Why are Wildfires a Threat to the Planning Area?\*

With its many steep canyons and open scrub-covered hillsides, the planning area has always been vulnerable to the hazards associated with brush fires. The earliest newspaper report of a wildfire on the Palos Verdes Peninsula was in October 1923, in which the Los Angeles Examiner reported a brush fire on the Palos Verdes Hills that burned an estimated 4,000 acres. Although no people were injured or killed and no structures were destroyed, a considerable amount of livestock perished in the fire, including 18 horses, 500 rabbits and an unspecified number of chickens. In September 1945, the Peninsula News reported on a grass fire near Crest Road (in probably what is now the City of Rolling Hills) that destroyed one home and caused an estimated \$50,000 worth of property damage. In June 1967, the Peninsula News reported that 45 acres had burned in the Portuguese Bend area. Although no residences were

#### \* ELEMENT B: HAZARD IDENTIFICATION AND RISK ASSESSMENT | B2

B2. Does the Plan include information on previous occurrences of hazard events and on the probability of future hazard events for each jurisdiction? (Requirement §201.6(c)(2)(i))

damaged in this incident, “considerable farm land was destroyed as fire trucks and other equipment had to cross the fields in order to fight the flames.”

While hardly a year goes by when there isn't at least one small brush fire in the planning area, by far the most destructive wildland fire to ravage the area to date occurred in June 1973. As reported in the Peninsula News, the fire was started accidentally on Friday, June 22, 1973 at approximately 2:30 PM by two youths playing with fireworks flash powder near the intersection of Whitley Collins Drive and Crenshaw Boulevard in Rancho Palos Verdes. An empty field at the time, this area has since been developed with housing (The Island View tract). The day was unusually warm, with temperatures in the 90's and wind speeds of 10 to 20 miles per hour. Fueled by the gusting and shifting winds, the fire spread east to the federal radar dome facility at what is now Del Cerro Park, narrowly bypassed this facility and continued to move into the City of Rolling Hills, where it completely destroyed 9 homes. When the winds shifted to west, the fire burned into the Portuguese Bend area of Rancho Palos Verdes and destroyed 3 more homes. In all, the 1973 fire consumed a total of 900 acres and raged for 28 hours before it was finally extinguished. Fortunately, no human lives were lost. However, in addition to the 12 homes that were destroyed, the conflagration also damaged 12 other structures. All told, the disaster caused \$1.3 million in private property damage in Rolling Hills and an additional \$130,000 worth of damage in Rancho Palos Verdes. The Peninsula News also noted that the fire narrowly missed the Wayfarers Chapel, but did destroy several Edison power poles in McCarrell's Canyon on the western margin of the fire. It appears that the Fire of 1973 is second only to the Portuguese Bend Landslide as the most devastating natural disaster that has ever befallen the planning area.

In urban areas, the effectiveness of fire protection efforts is based upon several factors, including the age of structures, efficiency of circulation routes that ultimately affect response times and availability of water resources to combat fires. In wildland areas, taking the proper precautions, such as the use of fire resistant building materials, a pro-active Fire Prevention inspection program, and the development of defensible space around structures where combustible vegetation is controlled, can protect developed lands from fires and, therefore, reduce the potential loss of life and property.

Other factors contribute to the severity of fires including weather and winds. Specifically, winds commonly referred to as Santa Ana winds, which occur during fire season (typically from June to the first significant rain in November) are particularly significant. Such “fire weather” is characterized by several days of hot dry weather and high winds, resulting in low fuel moisture in vegetation.

California experiences large, destructive wildland fires almost every year, and Los Angeles County is no exception. Wildland fires have occurred within the county, particularly in the fall of the year, ranging from small, localized fires to disastrous fires covering thousands of acres. The most severe fire protection problem in the area is wildland fire during Santa Ana wind conditions.

The planning area is considered to be a Severe Fire Hazard Zone according to the Los Angeles County Fire Department. The most recent fire hazard to affect the planning area was on January 9, 2012 when a brush fire burned approximately 15 acres in Rancho Palos Verdes. Fortunately, in recent history, the planning area has lost neither structures nor life to wildfires.

## Why are Wildfires a Threat to California?

A wildfire is an uncontrolled fire spreading through vegetative fuels and exposing or possibly consuming structures. They often begin unnoticed and spread quickly. Naturally occurring and non-native species of grasses, brush, and trees fuel wildfires. A Wildland Fire is a wildfire in an area in which development is essentially nonexistent, except for roads, railroads, power lines and similar facilities. A Wildland/Urban Interface Fire is a wildfire in a geographical area where structures and other human development meet or intermingle with wildland or vegetative fuels.

People start more than 80 percent of wildfires, usually as debris burns, arson, or carelessness. Lightning strikes are the next leading cause of wildfires. Wildfire behavior is based on three primary factors: fuel, topography, and weather. The type, and amount of fuel, as well as its burning qualities and level of moisture affect wildfire potential and behavior. The continuity of fuels, expressed in both horizontal and vertical components, is also a determinant of wildfire potential and behavior. Topography is important because it affects the movement of air (and thus the fire) over the ground surface. The slope and shape of terrain can change the speed at which the fire travels, and the ability of firefighters to reach and extinguish the fire. Weather affects the probability of wildfire and has a significant effect on its behavior. Temperature, humidity and wind (both short and long term) affect the severity and duration of wildfires. Los Angeles County's topography, consisting of a semi-arid coastal plain and rolling highlands, when fueled by shrub overgrowth, occasional Santa Ana winds and high temperatures, creates an ever-present threat of wildland fire. Extreme weather conditions such as high temperature, low humidity, and/or winds of extraordinary force may cause an ordinary fire to expand into one of massive proportions.

For thousands of years, fires have been a natural part of the ecosystem in Southern California. However, wildfires present a substantial hazard to life and property in communities built within or adjacent to hillsides and mountainous areas. There is a huge potential for losses due to wildland/urban interface fires in Southern California. According to the California Division of Forestry (CDF), there were over seven thousand reportable fires in California in 2003, with over one million acres burned. According to CDF statistics, in the October 2003 Firestorms, over 4,800 homes were destroyed and 22 lives were lost.

In late October 2007, Southern California experienced an unusually severe fire weather event characterized by intense, dry, gusty Santa Ana winds. This weather event drove a series of

destructive wildfires that took a devastating toll on people, property, natural resources, and infrastructure. Although some fires burned into early November, the heaviest damage occurred during the first three days of the siege when the winds were the strongest.

## Historic Fires in Southern California

Large fires have been part of the Southern California landscape for millennia. Written documents reveal that during the 19th century human settlement of southern California altered the fire regime of coastal California by increasing the fire frequency. This was an era of very limited fire suppression, and yet like today, large crown fires covering tens of thousands of acres were not uncommon. One of the largest fires in Los Angeles County (60,000 acres) occurred in 1878.

\*Data on structures damaged and destroyed was not available for all wildfires, just for the ones listed above.

During the 2003 fire season, more than 6.9 million acres of public and private lands burned in the U.S., resulting in loss of property, damage to resources, and disruption of community services. Taxpayers spent more than \$1.6 billion to combat more than 88,400 fires nationwide. Many of these fires burned in wildland/urban interface areas and exceeded the fire suppression capabilities of those areas. Table 5-5: National Fire Suppression Costs illustrates fire suppression costs for state, private and federal lands.

**Table 5-5: National Fire Suppression Costs**  
 (Source: [http://research.yale.edu/gisf/assets/pdf/ppf/wildfire\\_report.pdf](http://research.yale.edu/gisf/assets/pdf/ppf/wildfire_report.pdf))

| Year | Suppression Costs | Acres Burned | Structures Burned |
|------|-------------------|--------------|-------------------|
| 2000 | \$1.3 billion     | 8,422,237    | 861               |
| 2001 | \$0.5 billion     | 3,570,911    | 731               |
| 2002 | \$1.6 billion     | 6,937,584    | 815               |

### *The 2003 Southern California Fires*

The fall of 2003 marked the most destructive wildfire season in California history. In a ten day period, 12 separate fires raged across Southern California in Los Angeles, Riverside, San Bernardino, San Diego, and Ventura counties. The massive “Cedar Fire” in San Diego County alone consumed 2,800 homes and burned over a quarter of a million acres.

In October 2003, Southern California experienced the most devastating wildland fire disaster in state history. Over 739,597 acres burned; 3,631 homes, 36 commercial properties, and 1,169 outbuildings were destroyed; 246 people were injured; and 24 people died, including one firefighter. At the height of the siege, 15,631 personnel were assigned to fight the fires. (Source: State of California, *Governor’s Blue Ribbon Panel Fire Commission Report to the Governor*, 2004)

### *The 2007 Southern California Fires*

In late October 2007, Southern California experienced an unusually severe fire weather event characterized by intense, dry, gusty Santa Ana winds. This weather event drove a series of destructive wildfires that took a devastating toll on people, property, natural resources, and infrastructure. Although some fires burned into early November, the heaviest damage occurred during the first three days of the siege when the winds were the strongest. During this siege, 17 people

lost their lives, ten were killed by the fires outright, three were killed while evacuating, four died from other fire siege related causes, and 140 firefighters, and an unknown number of civilians were injured. A total of 3,069 homes and other buildings were destroyed, and hundreds more were damaged. Hundreds of thousands of people were evacuated at the height of the siege. The fires burned over half a million acres, including populated areas, wildlife habitat and watershed. Portions of the electrical power distribution network, telecommunications systems, and even some community water sources were destroyed. Transportation was disrupted over a large area for several days, including numerous road closures. Both the Governor of California and the President of the United States personally toured the ongoing fires. Governor Schwarzenegger proclaimed a state of emergency in seven counties before the end of the first day. President Bush quickly declared a major disaster. While the total impact of the 2007 fire siege was less than the disastrous fires of 2003, it was unquestionably one of the most devastating wildfire events in the history of California. (Source: [http://www.fire.ca.gov/fire\\_protection/downloads/siege/2007/Overview\\_Introduction.pdf](http://www.fire.ca.gov/fire_protection/downloads/siege/2007/Overview_Introduction.pdf))

# CAL FIRE 2010 Wildland Fire Summary

|   | <b>Number of Fires</b> | <b>Acres Burned</b> |
|---|------------------------|---------------------|
| <b>2010</b>                             | <b>2,961</b>           | <b>23,191</b>       |
| <b>2009</b>                             | <b>3,546</b>           | <b>73,098</b>       |
| <b>5 Yr. Avg.</b><br><i>(2005-2009)</i> | <b>4,765</b>           | <b>228,609</b>      |

These figures include fires and acres burned within CAL FIRE jurisdiction of State Responsibility Area

Fire Suppression Cost (Split over two fiscal years):  
 Fiscal Year July 2009- June 2010: \$274+ million  
 Fiscal Year July 2010 - June 2011: (estimated) \$51 million

Dollar Damage Costs: \$5.2 million

Structures Destroyed\*: 94 destroyed

## Top Five Fires in Acreage Burned\*\*

## Wildfire Characteristics

There are three categories wildland/urban interface fire: The classic wildland/urban interface exists where well-defined urban and suburban development presses up against open expanses

of wildland areas; the mixed wildland/urban interface is characterized by isolated homes, subdivisions, and small communities situated predominantly in wildland settings. The occluded wildland/urban interface exists where islands of wildland vegetation occur inside a largely urbanized area. Certain conditions must be present for significant interface fires to occur. The most common conditions include: hot, dry and windy weather; the inability of fire protection forces to contain or suppress the fire; the occurrence of multiple fires that overwhelm committed resources;

and a large fuel load (dense vegetation). Once a fire has started, several conditions influence its behavior, including fuel topography, weather, drought, and development.

Southern California has two distinct areas of risk for wildland fire. The foothills and lower mountain areas are most often covered with scrub brush or chaparral. The higher elevations of mountains also have heavily forested terrain. The lower elevations covered with chaparral create one type of exposure.

The higher elevations of Southern California's mountains are typically heavily forested. The magnitude of the 2003 fires is the result of three primary factors: 1) severe drought, accompanied by a series of storms that produce thousands of lightning strikes and windy conditions; 2) an infestation of bark beetles that has killed thousands of mature trees; and 3) the effects of wildfire suppression over the past century that has led to buildup of brush and small diameter trees in the forests.

“When Lewis and Clark explored the Northwest, the forests were relatively open, with 20 to 25 mature trees per acre. Periodically, lightning would start fires that would clear out underbrush and small trees, renewing the forests. Today's forests are completely different, with as many as 400 trees crowded onto each acre, along with thick undergrowth. This density of growth makes forests susceptible to disease, drought and, severe wildfires. Instead of restoring forests, these wildfires destroy them and it can take decades to recover. This radical change in our forests is the result of nearly a century of well-intentioned but misguided management.” (Source: Overgrown Forests Require Preventive Measures, By Gale A. Norton (Secretary of the Interior), USA Today Editorial, August 21, 2002)

## *The Interface*

One challenge Southern California faces regarding the wildfire hazard is from the increasing number of houses being built on the urban/wildland interface. Every year the growing population expands further into the hills and mountains, including forest lands. The increased "interface" between urban/suburban areas, and the open spaces created by this expansion, produces a significant increase in threats to life and property from fires, and pushes existing fire protection systems beyond original or current design and capability. Property owners in the interface are not aware of the problems and fire hazards or risks on their own property. Furthermore, human activities increase the incidence of fire ignition and potential damage.

## *Fuel*

Fuel is the material that feeds a fire and is a key factor in wildfire behavior. Fuel is classified by volume and by type. Volume is described in terms of "fuel loading," or the amount of available vegetative fuel.

The type of fuel also influences wildfire. Chaparral is a primary fuel of Southern California wildfires. Chaparral habitat ranges in elevation from near sea level to over 5,000' in Southern California. Chaparral communities experience long dry summers and receive most of their annual precipitation from winter rains. Although chaparral is often considered as a single species, there are two distinct types; hard chaparral and soft chaparral. Within these two types are dozens of different plants, each with its own particular characteristics.

"Fire has been important in the life cycle of chaparral communities for over 2 million years; however, the true nature of the "fire cycle" has been subject to interpretation. In a period of 750 years, it generally thought that fire occurs once every 65 years in coastal drainages and once every 30 to 35 years inland."

"The vegetation of chaparral communities has evolved to a point it requires fire to spawn regeneration. Many species invite fire through the production of plant materials with large surface-to-volume ratios, volatile oils, and through periodic die-back of vegetation. These species have further adapted to possess special reproductive mechanisms following fire. Several species produce vast quantities of seeds which lie dormant until fire triggers germination. The parent plant which produces these seeds defends itself from fire by a thick layer of bark which allows enough of the plant to survive so that the plant can crown sprout following the blaze. In general, chaparral community plants have adapted to fire through the following methods: a) fire induced flowering; b) bud production and sprouting subsequent to fire; and c) in-soil seed storage and fire stimulated germination; and d) on plant seed storage and fire stimulated dispersal."

An important element in understanding the danger of wildfire is the availability of diverse fuels in the landscape, such as natural vegetation, manmade structures and combustible materials. A house surrounded by brushy growth rather than cleared space allows for greater continuity of fuel and increases the fire's ability to spread. After decades of fire suppression "dog-hair" thickets have accumulated, which enable high intensity fires to flare and spread rapidly.

## *Topography*

Topography influences the movement of air, thereby directing a fire course. For example, if the percentage of uphill slope doubles, the rate of spread in wildfire will likely double. Gulches and canyons can funnel air and act as chimneys, which intensify fire behavior and cause the fire to spread faster. Solar heating of dry, south-facing slopes produces up slope drafts that can

complicate fire behavior. Unfortunately, hillsides with hazardous topographic characteristics are also desirable residential areas in many communities. This underscores the need for wildfire hazard mitigation and increased education and outreach to homeowners living in interface areas.

### *Weather*

Weather patterns combined with certain geographic locations can create a favorable climate for wildfire activity. Areas where annual precipitation is less than 30 inches per year are extremely fire susceptible. High-risk areas in Southern California share a hot, dry season in late summer and early fall when high temperatures and low humidity favor fire activity. The so-called “Santa Ana” winds, which are heated by compression as they flow down to Southern California from Utah, create a particularly high risk, as they can rapidly spread what might otherwise be a small fire.

### *Drought*

Recent concerns about the effects of climate change, particularly drought, are contributing to concerns about wildfire vulnerability. The term ‘drought’ is applied to a period in which an unusual scarcity of rain causes a serious hydrological imbalance. Unusually dry winters, or significantly less rainfall than normal, can lead to relatively drier conditions and leave reservoirs and water tables lower. Drought leads to problems with irrigation and contributes to additional fires, or increased difficulty in fighting fires.

### *Development*

Growth and development in scrubland and forested areas is increasing the number of human-caused structures in Southern California interface areas. Wildfire affects development, yet development can also influence wildfire. Owners often prefer homes that are private with scenic views, nestled in vegetation, and use natural materials. A private setting is usually far from public roads, or hidden behind a narrow, curving driveway. These conditions, however, make evacuation and firefighting difficult. The scenic views found along mountain ridges can also mean areas of dangerous topography. Natural vegetation contributes to scenic beauty, but it may also provide a ready trail of fuel leading a fire directly to the combustible fuels of the home itself.

## Wildfire Hazard Assessment

### *Hazard Identification*

Extreme weather conditions such as high temperature, low humidity, and/or winds of extraordinary force causes an ordinary fire to expand into one of massive proportions.

Wildfire hazard areas are commonly identified in regions of the wildland/urban interface. Ranges of the wildfire hazard are further determined by the ease of fire ignition due to natural or human conditions and the difficulty of fire suppression. The wildfire hazard is also magnified by several factors related to fire suppression/control such as the surrounding fuel load, weather, topography, and property characteristics.

Generally, hazard identification rating systems are based on weighted factors of fuels, weather and topography. In order to determine the “base hazard factor” of specific wildfire hazard sites and interface regions, several factors must be taken into account. Categories used to assess the base hazard factor include:

- ✓ Topographic location, characteristics and fuels
- ✓ Site/building construction and design
- ✓ Site/region fuel profile (landscaping)
- ✓ Defensible space
- ✓ Accessibility
- ✓ Fire protection response
- ✓ Water availability

### *Risk Analysis*

Southern California residents are served by a variety of local fire departments as well as county, state and federal fire resources. Data that includes the location of interface areas in the county can be used to assess the population and total value of property at risk from wildfire and direct these fire agencies in fire prevention and response.

Key factors included in assessing wildfire risk include ignition sources, building materials and design, structural density, slope, vegetative fuel, fire occurrence and weather, as well as occurrences of drought.

The National Wildland/Urban Fire Protection Program has developed the Wildland/Urban Fire Hazard Assessment Methodology tool for communities to assess their risk to wildfire. For more information on wildfire hazard assessment refer to <http://www.Firewise.org>.

Fire hazards of concern in the planning area are those associated with structures and brush, as well as earthquake induced fires. Fire potential is typically greatest in the months of August, September, and October, when dry vegetation, combined with offshore dry Santa Ana winds, create a high potential for spontaneous fires. The hillsides and steep slopes facilitate rapid fire spread.

## Local Conditions

Fire hazards threaten lives, property, and natural resources, and impact vegetation and wildlife habitats.

### *Weather*

Weather conditions have many complex and important effects on fire intensity and behavior. Wind is of prime importance; as wind increases in velocity, the rate of fire spread also increases. Relative humidity (i.e., relative dryness of the air) also has a direct effect, the drier the air, and the drier the vegetation; the more likely the vegetation will ignite and burn. Precipitation (annual total, seasonal distribution and storm intensity) further affects the moisture content of dead and living vegetation, which influences fire ignition and behavior.

In addition to winds, structural development within or adjacent to wildland exposures represents an extreme fire protection problem due to flying embers and the predominance of combustible roof coverings.

### *Topography*

Topography affects wildland fire behavior, and the ability of firefighters and their equipment to take action to suppress those fires. One example is a fire starting in the bottom of a canyon may expand quickly to the ridge top before initial attack forces can arrive. Rough topography greatly limits road construction, road standards, and accessibility by ground equipment. Steep topography also channels airflow, creating extremely erratic winds on lee slopes and in canyons. Water supply for fire protection to structures at higher elevations is frequently dependent on pumping units. The source of power for such units is usually from overhead distribution lines, which are subject to destruction by wildland fires.

### *Vegetation*

A key to effective fire control and the successful accommodation of fire in wildland management is the understanding of fire and its environment. Fire environment is the complex of fuel, topographic, and air mass factors, that influence the inception, growth, and behavior of a fire. The topography and weather components are, for all practical purposes, beyond man's control, but it is a different story with fuels, which can be controlled before the outbreak of fires. In terms of future urban expansion, finding new ways to control and understand these fuels can lead to possible fire reduction.

Of these different vegetation types, coastal sage scrub, chaparral, and grasslands reach some degree of flammability during the dry summer months and, under certain conditions, during the winter months. For example, as chaparral gets older, twigs and branches within the plants die and are held in place. A stand of brush 10 to 20-years of age usually has enough dead material to produce rates of spread about the same as in grass fires when the fuels have dried out. In severe drought years, additional plant material may die, contributing to the fuel load. There will normally be enough dead fuel accumulated in 20 to 30-year old brush to give rates of spread about twice as fast as in a grass fire. Under moderate weather conditions that produce a spread rate of one-half foot per second in grass, a 20 to 30-year old stand of chaparral may have a rate of fire spread of about one foot per second. Fire spread in old brush (40 years or older) has been measured at eight times as fast as in grass, about four feet per second. Under extreme weather conditions, the fastest fire spread in grass is 12 feet per second or about eight miles per hour.

## **Community Wildfire Issues**

### *What is Susceptible to Wildfires?*

The planning area has identified properties within Very High Fire Hazard Severity Zones as shown in Maps 5-1 through 5-4. Defensible space can be created around structures by taking precautionary measures such as: 1) thinning trees and brush within a minimum of 30-feet of any structure or 50-feet of any structure in areas determined to be high hazard, 2) beyond 30-feet, remove dead wood, debris and low tree branches, 3) keeping lawns trimmed, leaves raked, and the roof and rain-gutters free from debris such as dead limbs and leaves, 4) stacking firewood at

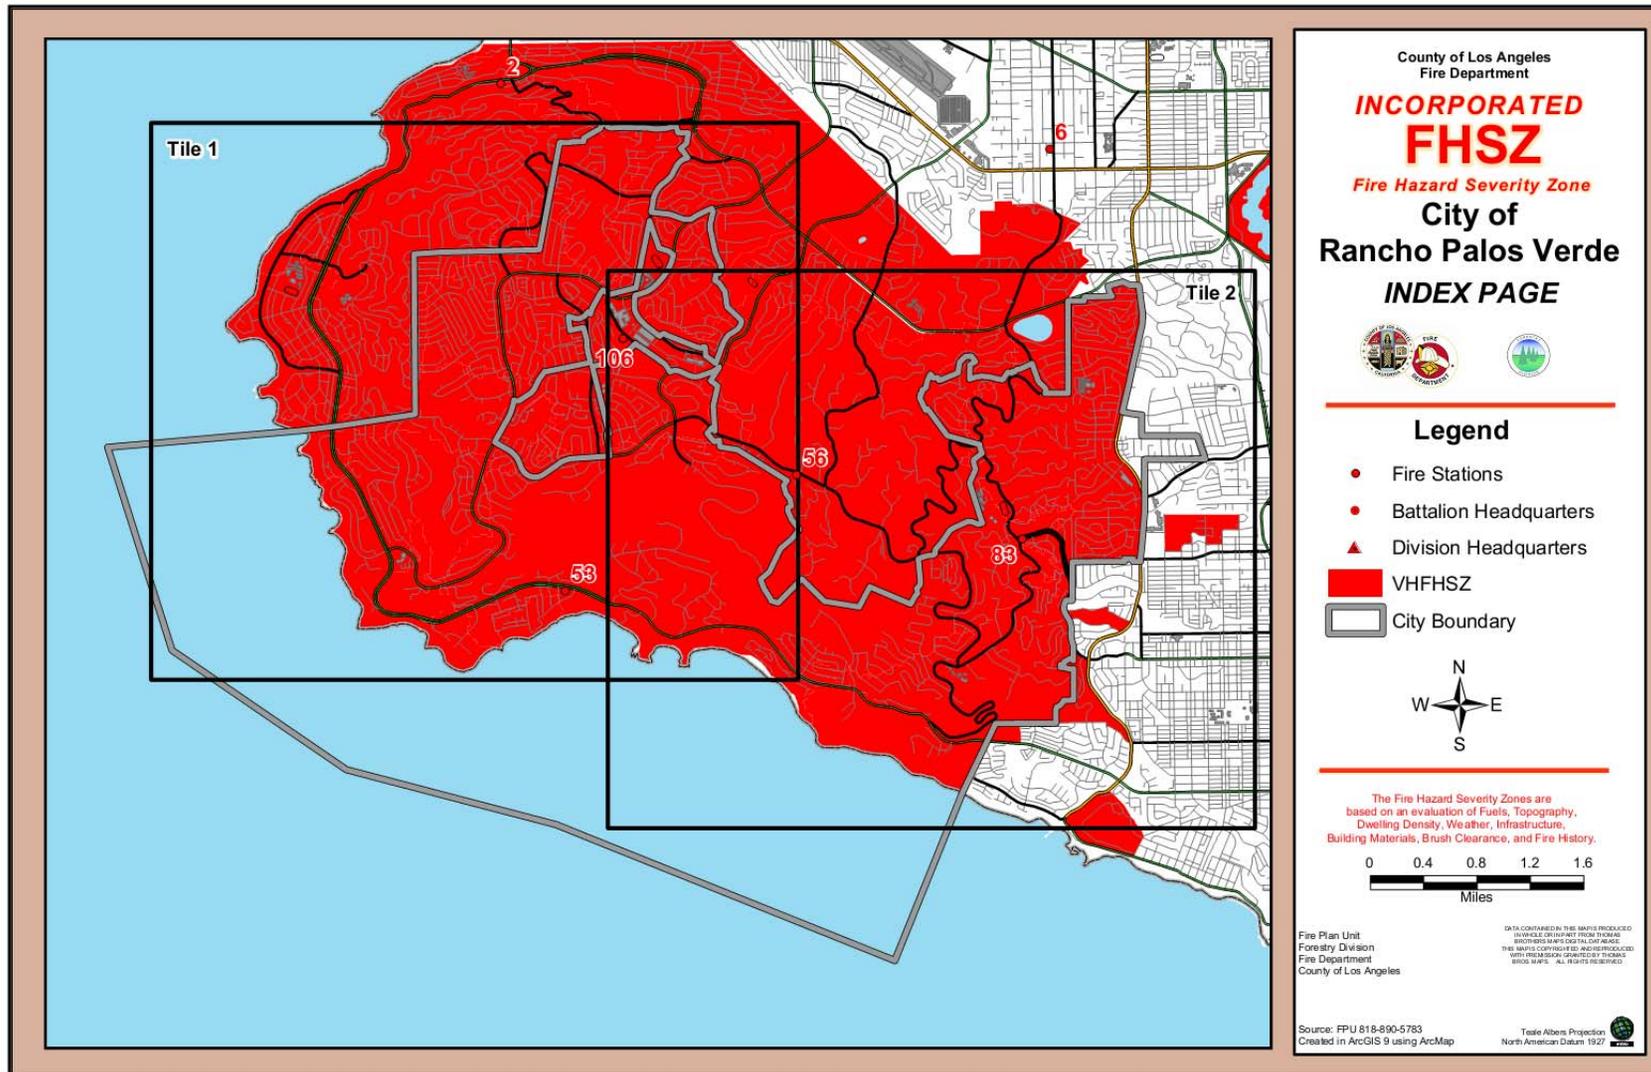

least 30-feet away from a home, and 5) storing flammable materials, liquids and solvents in metal containers outside the home at least 30-feet away from structures and wooden fences.

In the planning area, this scenario highlights the need for fire mitigation activity in all sectors of the region, wildland/urban interface or not. Examples of actions homeowners can take to mitigate fires include:

- ✓ Define a defensible space of a 30-foot non-combustible buffer area around the house and/or 50-foot in areas determined to be high hazard
- ✓ Reduce flammable vegetation, trees, and brush around the house
- ✓ Remove or prune trees
- ✓ Cut grass and weeds regularly
- ✓ Relocate wood piles and leftover materials
- ✓ Keep the area clean
- ✓ Install fire resistant roofing materials, spark arrestors on chimneys, and screen vents in eaves and decorative cornices

## Impact of Wildfires in the Planning Area\*

Wildfires and their impact varies by location and severity of any given wildfire event, and will likely only affect certain areas of the county during specific times. Based on the risk assessment, it is evident that wildfires will have potentially devastating economic impact to certain areas of the planning area. Impact that is not quantified, but can be anticipated in future events, includes:

- ✓ Injury and loss of life
- ✓ Commercial and residential structural damage
- ✓ Disruption of and damage to public infrastructure
- ✓ Secondary health hazards e.g. mold and mildew
- ✓ Damage to roads/bridges resulting in loss of mobility
- ✓ Significant economic impact (jobs, sales, tax revenue) upon the community
- ✓ Negative impact on commercial and residential property values
- ✓ Significant disruption to students and teachers as temporary facilities and relocations would likely be needed

### *Severity*

The primary effects of fire, such as loss of life, injury, destruction of buildings and wildlife, are generally well known. Fire also has a number of secondary effects, such as strained public utilities, depleted water supplies, downed power lines, disrupted telephone systems, and closed roads. In addition, flood control facilities are overtaxed by the increased flow from bare hillsides, and the resulting debris that washes down. Affected recreation areas may have to close or restrict operations. Moreover, buildings destroyed by fire are usually eligible for property tax reassessment, which reduces revenue to local government.

A fire is usually extinguished within a few days, but its effects last much longer. Grassland re-sprouts the following spring, a chaparral community regenerate in three to five years, and oak woodland with most of its seedlings and saplings destroyed will start a new crop within five to ten years. Coniferous timber stands are most susceptible to long-term damage, taking as much as 50 to 100 years to re-establish a forest.

Fire destroys surface vegetation, leaving the soil bare and subject to erosion, when the rains begin in the fall and winter. Raindrops hit the surface with undiminished impact, splashing particles of soil loose that move downhill and are carried away by running water. Fire also destroys most of the roots that hold the soil in place, allowing running water to wash the soil away. Mudslides and mudflows can result from these processes.

### *Growth and Development in the Interface*

The hills and mountainous areas of Southern California are considered to be interface areas. The development of homes and other structures is encroaching onto the wildlands and is expanding the wildland/urban interface. The interface neighborhoods are characterized by a

#### \* ELEMENT B: HAZARD IDENTIFICATION AND RISK ASSESSMENT | B3

B3. Is there a description of each identified hazard's impact on the community as well as an overall summary of the community's vulnerability for each jurisdiction? (Requirement §201.6(c)(2)(ii))

diverse mixture of varying housing structures, development patterns, ornamental and natural vegetation, and natural fuels.

In the event of a wildfire, vegetation, structures, and other flammables can merge into unwieldy and unpredictable events. Factors important to the fighting of such fires include access, firebreaks, proximity of water sources, distance from a fire station, and available firefighting personnel and equipment. Reviewing past wildland/urban interface fires shows that many structures are destroyed or damaged for one or more of the following reasons:

- ✓ Combustible roofing material
- ✓ Wood construction
- ✓ Structures with no defensible space
- ✓ Fire department has poor access to structures
- ✓ Subdivisions located in heavy natural fuel types
- ✓ Structures located on steep slopes covered with flammable vegetation
- ✓ Limited water supply
- ✓ Winds over 30 miles per hour

### *Road Access*

Road access is a major issue for all emergency service providers. As development encroaches into the rural areas of the county, the number of houses without adequate turn-around space is increasing. In many areas, there is not adequate space for emergency vehicle turnarounds in single-family residential neighborhoods, obstructing emergency workers because they cannot access houses. Fire trucks are large, and firefighters are challenged by narrow roads and limited access. When there is inadequate turn around space, the fire fighters can only work to remove the occupants, but cannot safely remain to save the threatened structures.

### *Water Supply*

Fire fighters in remote and rural areas are faced by limited water supply and lack of hydrant taps. Rural areas are characteristically outfitted with small diameter pipe water systems, inadequate for providing sustained firefighting flows.

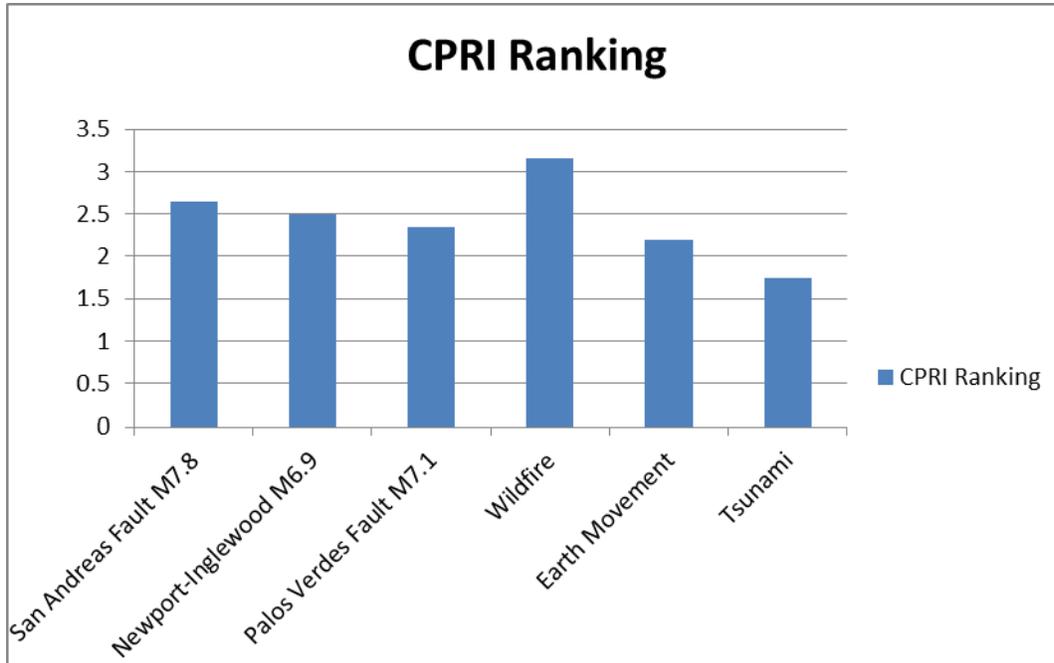

### *Interface Fire Education Programs and Enforcement*

Fire protection in urban/wildland interface areas may rely heavily more on the landowner's personal initiative to take measures to protect his or her own property. Therefore, public education and awareness plays a greater role in interface areas. In those areas with strict fire codes, property owners who resist maintaining the minimum brush clearances can be cited for failure to clear brush.

### *Need for Mitigation Programs*

Continued development into the interface areas has growing impact on the wildland/urban interface. Periodically, the historical losses from wildfires in Southern California are catastrophic, with historical deadly and expensive fires. The continued growth and development increases the public need for mitigation planning in Southern California.

## Section 6: Earth Movement Hazards (Landslide & Debris Flow)

| Calculated Priority Risk Index (CPRI) |                   |
|---------------------------------------|-------------------|
| Probability:                          | Possible          |
| Magnitude/Severity:                   | Limited           |
| Warning Time:                         | Less than 6 hours |
| Duration:                             | Less than 6 hours |

### Why are Landslides a Threat to the Planning Area?\*

Landslides are a serious geologic hazard in almost every state in America. Nationally, landslides cause 25 to 50 deaths each year. The best estimate of direct and indirect costs of landslide damage in the United States range between \$1 and \$2 billion annually. As a seismically active region, California has a significant number of locations impacted by landslides. Some landslides result in private property damage; other landslides impact transportation corridors, fuel and energy conduits, and communication facilities. They can also pose a serious threat to human life.

Landslides can be broken down into two categories: 1) rapidly moving (generally known as debris flows), and; 2) slow moving. Rapidly moving landslides or debris flows present the

#### \* ELEMENT B: HAZARD IDENTIFICATION AND RISK ASSESSMENT | B2

B2. Does the Plan include information on previous occurrences of hazard events and on the probability of future hazard events for each jurisdiction? (Requirement §201.6(c)(2)(i))

greatest risk to human life, and people living in or traveling through areas prone to rapidly moving landslides, are at increased risk of serious injury. Slow moving landslides can cause significant property damage, but are less likely to result in serious human injuries.

|   |   |
|---|---|
| <hr/> <p>Landslides/mudslides can cause abrupt depression and lateral displacement of hillside surfaces over distances of up to several hundreds of feet, disruption of surface drainage, blockage of flood control channels and roadways and displacement or destruction of improvements such as roadways, buildings, and water wells.</p> <hr/> | <p>The primary effects of mudslides/landslides include: abrupt depression and lateral displacement of hillside surfaces over distances of up to several hundreds of feet, disruption of surface drainage, blockage of flood control channels and roadways, displacement or destruction of improvements such as roadways, buildings, and water wells.</p> <p>In terms of avoiding the hazards of earth movement, the planning area has been far less fortunate. Although geologic maps of the Palos Verdes Peninsula made in the 1930's and published in 1946 clearly depict several ancient landslides, they were apparently not considered or discounted in later construction activities (Woodring, W.P., N. Bramlette and W.S.W. Kew: Geology and Paleontology of the Palos Verdes Hills, Geologic Survey Professional Paper 207, U.S. Department of the Interior, 1946).</p> <p>The first and largest landslide to occur in the planning area was the Portuguese Bend Landslide. The slide area encompasses approximately 270 acres. The weight of the moving material is estimated to be about 60 million tons, with a maximum thickness calculated to be 250 feet. The slide began in August 1956 in conjunction with a County roadway project to extend Crenshaw Boulevard from Crest Road to Palos Verdes Drive South. Initially, movement was 3 to 4 inches per day, quickly slowing to 1 inch per day a month later. The reactivation of this ancient landslide</p> |
|---|---|

resulted in the loss of 134 residential dwellings, which were damaged beyond repair and razed. Relocation to safer ground saved a few homes. (The Palos Verdes Peninsula: A Geologic Guide and More, by Martin Reiter, Kendall/Hunt Publishing Company, 1984) The slide also destroyed the Portuguese Bend Beach Club (Reiter, 1984), a private recreational facility that included a large clubhouse, saltwater pool, boating pier, tennis courts, and volleyball courts (PV News, 1948 & 1952). Between 1962 and 1970, movement slowed to ½ inch per day (Reiter, 1984). Today, movement is approximately 3 feet per year, depending on the amount of rainfall the previous season. Nearly all of the remaining homes in the active slide area have been placed on elevated or so-called “floating” foundations that can be adjusted as the earth continues to slowly move and buckle beneath the homes.

Reactivation of the 80-acre Abalone Cove Landslide was first noted at the shoreline in February 1974. At the time, Abalone Cove was a private beach club. Slow movement continued between the shoreline and Palos Verdes Drive South until 1978, but only impacted vacant land. In late April or early May 1978, following one of the rainiest seasons on record (29.61 inches fell during 1977-78 compared to an average annual rainfall of 11.38 inches), the slide began to accelerate and cracking was seen in the roadway. The slide reached its maximum inland extent in February 1980, following 7.75 inches of rain during a 10-day period. Because the Abalone Cove Landslide started along the coastline and progressed landward, it was not triggered by drag from the abutting Portuguese Bend Landslide. The major factors attributed to reactivation of the slide appear to be rainfall and rising groundwater levels (Reiter, 1984). Although no homes were destroyed as a result of this slide, the visitor’s center at the landmark Wayfarers

Chapel was severely damaged and closed to the public in 1982. All but a small portion of the original structure was razed in 1995 and a new visitors center was constructed west of the slide scarp in 1999 (Daily Breeze, June 26, 1999).

A third landslide in the planning area that deserves mention is the Klondike Canyon Landslide. This landslide is located adjacent to the coastline and to the east of the much larger Portuguese Bend Landslide. Like the Portuguese Bend and the Abalone Cove Landslides, Woodring published the location of the ancient “Beach Club Landslide” in 1946. However, by that time, both Yacht Harbor Drive (in 1927) and Palos Verdes Drive South (in 1937) had been constructed across this landslide. Development of the two roadways was followed in the late 1940’s by the construction of the Portuguese Bend Club and grading for the Seaview tract landward of Palos Verdes Drive South was completed in late 1956. Following record-breaking rainfall in 1977-1978, the first indications of movement of the Klondike Canyon Landslide were noted in September 1979 at the intersection of Dauntless Drive and Exultant Drive in the Seaview tract. Heavy rainfall continued during 1979-1980 and 1982-1983, accelerating land movement, which damaged local roads and eventually destroyed one home in the Seaview tract. In 1982, the Klondike Canyon Landslide Geologic Abatement District was formed and began installing dewatering wells to lower the ground water table within the slide mass. (Kerwin, Scott, “Land Stability in the Klondike Canyon,” Moore and Taber professional report, no date but probably 1981 or 1982) The dewatering efforts have been successful in stabilizing the area and additional landslide abatement efforts have continued since that time, such as drainage improvements in Klondike Canyon and the installation of a private sewer system in the Portuguese Bend Beach Club.

Unlike the slower moving landslides in the Portuguese Bend area, the planning area most recently experienced two fast-moving earth failures that each caused a considerable amount of property damage. In March 1997, two office buildings located in the 900 block of Indian Peak Road in Rolling Hills Estates toppled and slid down a hillside, causing damage to another building at 655 Deep Valley Drive. In June 1999, the entire 18th fairway of the Ocean Trails Golf Course slid into the ocean, just a week prior to the course’s scheduled grand opening, taking approximately 12 acres of land with it.

In its 38-year history, the City of Rancho Palos Verdes has only declared a local emergency on two occasions, both related to earth movement caused by severe weather. On March 8, 1979, the City of Rancho Palos Verdes declared a local emergency due to severe land movement resulting from heavy and unusual rains. Rancho Palos Verdes again declared a local emergency on January 17, 1995 due to severe El Nino rainstorms that caused flooding and sliding throughout the community.

## Historic Southern California Landslides

### *1928 St. Francis Dam*

Cost, \$672.1 million (2000 Dollars). The dam, located in Los Angeles County, gave way on March 12, and its waters swept through the Santa Clara Valley toward the Pacific Ocean, about 54 miles away. Sixty five miles of valley was devastated, and over 500 people were killed.

### *1956 Portuguese Bend*

Cost, \$14.6 million (2000 Dollars). California Highway 14, Palos Verdes Hills. Land use on the Palos Verdes Peninsula consists mostly of single-family homes built on large lots, many of

which have panoramic ocean views. All of the houses were constructed with individual septic systems, generally consisting of septic tanks and seepage pits. Landslides have been active here for thousands of years, but recent landslide activity has been attributed in part to human activity. The Portuguese Bend Landslide began its modern movement in August 1956, when displacement was noticed at its northeast margin. Movement gradually extended down slope so that the entire eastern edge of the slide mass was moving within 6 weeks. By the summer of 1957, the entire slide mass was sliding towards the sea.

### *1958-1971 Pacific Palisades*

Cost, \$29.1 million (2000 Dollars). California Highway 1 and house damaged.

### *1961 Mulholland Cut*

Cost, \$41.5 million (2000 Dollars). On Interstate 405, 11 miles north of Santa Monica, Los Angeles County.

### *1963 Baldwin Hills Dam*

Cost, \$50 million (1963 Dollars). On December 14, the 650 foot long by 155 foot high earth fill dam gave way and sent 360 million gallons of water in a fifty foot high wall cascading onto the community below, killing five persons.

### *1969 Glendora*

Cost, \$26.9 million (2000 Dollars). Los Angeles County, 175 houses damaged, mainly by debris flows.

### *1969 Seventh Ave., Los Angeles County*

Cost, \$14.6 million (2000 Dollars). California Highway 60.

### *1970 Princess Park*

Cost, \$29.1 million (2000 Dollars). California Highway 14, ten miles north of Newhall, near Saugus, northern Los Angeles County.

### *1971 Upper and Lower Van Norman Dams, San Fernando*

Cost, \$302.4 million (2000 Dollars). Earthquake-induced landslides. Damage due to the February 9, 1971, M7.5 San Fernando, Earthquake. The earthquake of February 9 severely damaged the Upper and Lower Van Norman Dams.

### *1971 Juvenile Hall, San Fernando*

Cost, \$266.6 million (2000 Dollars). Landslides caused by the February 9, 1971, San Fernando earthquake. In addition to damaging the San Fernando Juvenile Hall, this 1.2 km-long slide damaged trunk lines of the Southern Pacific Railroad, San Fernando Boulevard, Interstate Highway 5, the Sylmar electrical converter station, and several pipelines and canals.

### *1977-1980 Monterey Park, Repetto Hills, Los Angeles County*

Cost, \$14.6 million (2000 Dollars). 100 houses damaged in 1980 due to debris flows.

### *1978 Bluebird Canyon Orange County*

Cost, \$52.7 million (2000 Dollars). October 2, 60 houses destroyed or damaged. Unusually heavy rains in March of 1978 may have contributed to initiation of the landslide. Although the 1978 slide area was approximately 3.5 acres, it is suspected to be a portion of a larger, ancient landslide.

### *1979 Big Rock, California, Los Angeles County*

Cost, \$1.08 billion (2000 Dollars). California Highway 1 rockslide.

### *1980 Southern California Slides*

Cost, \$1.1 billion in damage (2000 Dollars). Heavy winter rainfall in 1979-90 caused damage in six Southern California counties. In 1980, the rainstorm started on February 8. A sequence of 5 days of continuous rain and 7 inches of precipitation had occurred by February 14. Slope failures were beginning to develop by February 15 and then very high-intensity rainfall occurred on February 16. As much as eight inches of rain fell in a six hour period in many locations. Records and personal observations in the field on February 16 and 17 showed that the mountains and slopes literally fell apart on those two days.

### *1983 San Clemente, Orange County*

Cost, \$65 million (2000 Dollars). California Highway 1. Litigation at that time involved approximately \$43.7 million (2000 Dollars?).

### *1983 Big Rock Mesa*

Cost, \$706 million (2000 Dollars) in legal claims, condemnation of 13 houses, and 300 more threatened rockslide caused by rainfall.

### *1978-1980 San Diego County*

Experienced major damage from storms in 1978, 1979, and 1979-80, as did neighboring areas of Los Angeles and Orange County. One hundred and twenty landslides were reported to have occurred in San Diego County during these 2 years. Rainfall for the rainy seasons of 78-79 and 79-80 was 14.82 and 15.61 inches (37.6 and 39.6 cm) respectively, compared to a 125-year average (1850-1975) of 9.71 inches (24.7 cm). Significant landslides occurred in the Friars Formation, a unit that was noted as slide-prone in the Seismic Safety Study for the City of San Diego. Of the nine landslides that caused damage in excess of \$1 million, seven occurred in the Friars Formation, and two in the Santiago Formation in the northern part of San Diego County.

### *1994 Northridge Earthquake Landslides*

As a result of the M6.7 Northridge Earthquake, more than 11,000 landslides occurred over an area of 10,000 km<sup>2</sup>. Most were in the Santa Susana Mountains and in mountains north of the Santa Clara River Valley. Destroyed dozens of homes, blocked roads, and damaged oil-field infrastructure. Caused deaths from Coccidioidomycosis (valley fever) the spore of which was released from the soil and blown toward the coastal populated areas. The spore was released from the soil by the landslide activity.

### *March 1995 Los Angeles and Ventura Counties*

Above normal rainfall triggered damaging debris flows, deep-seated landslides, and flooding. Several deep-seated landslides were triggered by the storms, the most notable was the La Conchita landslide, which in combination with a local debris flow, destroyed or badly damaged 11 to 12 homes in the small town of La Conchita, about 20 km west of Ventura. There also was widespread debris-flow and flood damage to homes, commercial buildings, and roads and highways in areas along the Malibu coast that had been devastated by wildfire two years before.

### *January 2005 Ventura County*

On January 10, 2005, a landslide once again struck the community of La Conchita, killing ten people and destroying or seriously damaging 36 houses.

## Landslide Characteristics

### *What is a landslide?*

“A landslide is defined as, the movement of a mass of rock, debris, or earth movement down a slope. Landslides are a type of “mass wasting” which denotes any down slope movement of soil and rock under the direct influence of gravity. The term “landslide” encompasses events such as rock falls, topples, slides, spreads, and flows.

Landslides are initiated by rainfall, earthquakes, volcanic activity, changes in groundwater, disturbance and change of a slope by human-caused construction activities, or any combination of these factors. Landslides also occur underwater, causing tidal waves and damage to coastal areas. These landslides are called submarine landslides.”

The size of a landslide usually depends on the geology and the initial cause of the landslide. Landslides vary greatly in their volume of rock and soil, the length, width, and depth of the area affected, frequency of occurrence, and speed of movement. Some characteristics that determine the type of landslide are slope of the hillside, moisture content, and the nature of the underlying materials. Landslides are given different names, depending on the type of failure, and their composition and characteristics.

Slides move in contact with the underlying surface. These movements include rotational slides where sliding material moves along a curved surface and translational slides where movement occurs along a flat surface. These slides are generally slow moving and can be deep. Slumps are small rotational slides that are generally shallow. Slow-moving landslides occur on relatively gentle slopes and cause significant property damage, but are far less likely to result in serious injuries than rapidly moving landslides.

“Failure of a slope occurs when the force that is pulling the slope downward (gravity) exceeds the strength of the earth materials that compose the slope. They move slowly, (millimeters per

year) or move quickly and disastrously, as is the case with debris-flows. Debris-flows travels down a hillside of speeds up to 200 miles per hour (more commonly, 30 – 50 miles per hour), depending on the slope angle, water content, and type of earth and debris in the flow. These flows are initiated by heavy, usually sustained, periods of rainfall, but sometimes happen as a result of short bursts of concentrated rainfall in susceptible areas. Burned areas charred by wildfires are particularly susceptible to debris flows, given certain soil characteristics and slope conditions.”

### *What is a Debris Flow?*

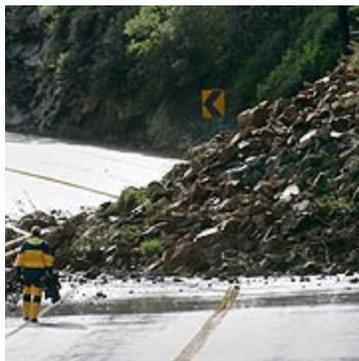

A debris or mud flow is a river of rock, earth and other materials, including vegetation that is saturated with water. This high percentage of water gives the debris flow a very rapid rate of movement down a slope. Debris flows often with speeds greater than 20 mile per hour, and often move much faster. This high rate of speed makes debris flows extremely dangerous to people and property in its path.

## Local Conditions

Landslides are a common hazard in California. Weathering and the decomposition of geologic materials produces conditions conducive to landslides, and human activity, further exacerbates many landslide problems.

Many landslides are difficult to mitigate, particularly in areas of large historic movement with weak underlying geologic materials. As communities continue to modify the terrain and influence natural processes, it is important to be aware of the physical properties of the underlying soils as they, along with climate, create landslide hazards. Even with proper planning, landslides continue to threaten the safety of people, property, and infrastructure, but without proper planning, landslide hazards are even more common and more destructive.

The increasing scarcity of buildable land, particularly in urban areas, increases the tendency to build on geologically marginal land. Additionally, hillside housing developments in Southern California are prized for the view lots that they provide.

Rock falls occur when blocks of material come loose on steep slopes. Weathering, erosion, or excavations, such as those along highways, cause falls where the road has been cut through bedrock. They are fast moving with the materials free falling or bouncing down the slope. In falls, material is detached from a steep slope or cliff. The volume of material involved is generally small, but large boulders or blocks of rock can cause significant damage.

Earth flows are plastic or liquid movements in which land mass (e.g. soil and rock) breaks up and flows during movement. Earthquakes often trigger flows. Debris flows normally occur when a landslide moves down slope as a semi-fluid mass scouring, or partially scouring soils from the slope along its path. Flows are, typically, rapidly moving, and tend to increase in volume as they scour out the channel. Flows often occur during heavy rainfall, can occur on gentle slopes, and move rapidly for large distances.

Landslides are often triggered by periods of heavy rainfall. Earthquakes, subterranean water flow, and excavations can also trigger landslides. Certain geologic formations are more susceptible to landslides than others. Human activities, including locating development near steep slopes, can increase susceptibility to landslide events. Landslides on steep slopes are more dangerous because movements are rapid.

Although landslides are a natural geologic process, the incidence of landslides and the impact on people are exacerbated by human activities. Grading for road construction and development increases slope steepness. Grading and construction decreases the stability of a hill slope by adding weight to the top of the slope, removing support at the base of the slope, and increasing water content. Other human activity affecting landslides include: 1) excavation, 2) drainage and groundwater alterations, and 3) changes in vegetation.

Wildland fires in hills covered with chaparral are often a precursor to debris flows in burned out canyons. The extreme heat of a wildfire creates a soil condition in which the earth becomes impervious to water by creating a waxy-like layer just below the ground surface. Since the water cannot be absorbed into the soil, it rapidly accumulates on slopes, often gathering loose particles of soil in to a sheet of mud and debris. Debris flows often originates miles away from unsuspecting persons, and approaches them at a high rate of speed with little warning.

Natural processes can cause landslides or re-activate historical landslide sites. The removal or undercutting of shoreline-supporting material along bodies of water by currents and waves produces countless small slides each year. Seismic tremors can trigger landslides on slopes historically known to have landslide movement. Earthquakes also cause additional failure (lateral spreading) that occurs on gentle slopes above steep streams and riverbanks.

### *Areas Particularly Susceptible to Landslides*

Locations at risk from landslides or debris flows include areas with one or more of the following conditions:

- ✓ On or close to steep hills
- ✓ Steep road-cuts or excavations
- ✓ Existing landslides or places of known historic landslides (such sites often have tilted power lines, trees tilted in various directions, cracks in the ground, and irregular-surfaced ground)
- ✓ Steep areas where surface runoff is channeled, such as below culverts, V-shaped valleys, canyon bottoms, and steep stream channels
- ✓ Fan-shaped areas of sediment and boulder accumulation at the outlets of canyons
- ✓ Canyon areas below hillside and mountains that recently (within 1-6 years) were subjected to a wildland fire

### *Impacts of Development*

Although landslides are a natural occurrence, human impact can substantially affect the potential for landslide failures in the planning area. Proper planning and geotechnical engineering will reduce the threat of safety of people, property, and infrastructure.

### *Excavation and Grading*

Slope excavation is common in the development of home sites or roads on sloping terrain. Grading these slopes results in slopes that are steeper than the pre-existing natural slopes. Since slope steepness is a major factor in landslides, these steeper slopes are at an increased risk for landslides. The added weight of fill placed on slopes also results in an increased landslide hazard. Small landslides are fairly common along roads, in either the road cut or the road fill. Landslides occurring below new construction sites are indicators of the potential impacts stemming from excavation.

### *Drainage and Groundwater Alterations*

Water flowing through or above ground, is often the trigger for landslides. Any activity that increases the amount of water flowing into landslide-prone slopes increases landslide hazards. Broken or leaking water or sewer lines can be especially problematic, as does water retention facilities that direct water onto slopes. However, even lawn irrigation in landslide prone locations results in damaging landslides. Ineffective storm water management and excess runoff also cause erosion, and increase the risk of landslide hazards. Drainage is affected, naturally by the geology and topography of an area. Development that results in an increase in impervious surface impairs the ability of the land to absorb water and redirects water to other areas. Channels, streams, ponding, and erosion on slopes indicate potential slope problems.

Road and driveway drains, gutters, downspouts, and other constructed drainage facilities concentrates and accelerates flow. Ground saturation and concentrated velocity flow are major causes of slope problems and triggers landslides.

### *Changes in Vegetation*

Removing vegetation from very steep slopes increases landslide hazards. Areas that experience wildfire and land clearing for development may have long periods of increased landslide hazard. Also, certain types of ground cover require constant watering to remain green. Changing away from native ground cover plants increases the risk of landslide.

## Landslide Hazard Assessment

### *Hazard Identification*

Landslide deposits include relatively shallow surficial slumps, mudflows, and debris flows, which develop within the near surface topsoils, colluviums, and weathered formational materials. Larger landslide features include deep-seated landslides within the formational sedimentary rock materials. In general, the landslides occur due to various factors including steep slope conditions, erosion, rainfall, groundwater, adverse geologic structure, and grading impacts. Large, deep-seated landslides commonly develop when weak dipping bedding planes daylight along a slope face. Faulting is also a common factor in the development of planes of weakness which contribute to landslide potential.

Map 6-1: Planning Area Landslide Hazard Map  
(Source: Cal OES)

### *Vulnerability Assessment*

Vulnerability assessment for landslides assists in predicting how different types of property and population groups are affected by a hazard. Data that includes specific landslide-prone and debris flow locations in the planning area are used to assess the population and total value of property at risk from future landslide occurrences.

Both Cities use percent of slope as a general indicator of hill slope stability. The City of Rancho Palos Verdes uses a 35% or greater threshold, and the City of Rolling Hills Estates uses a 33.3% or greater threshold to identify potentially unstable hill slopes.

While a quantitative vulnerability assessment (an assessment that describes number of lives or amount of property exposed to the hazard) has not yet been conducted for landslide events impacting the planning area, there are many qualitative factors that point to potential vulnerability. Landslides can impact major transportation arteries, blocking residents from essential services.

Past landslide events have caused major property damage or significantly impacted City residents, and continuing to map City landslide and debris flow areas will help in preventing future loss.

### *Risk Analysis*

Factors included in assessing landslide risk include population and property distribution in the hazard area, the frequency of landslide or debris flow occurrences, slope steepness, soil characteristics, and precipitation intensity.

## Rancho Palos Verdes, California

### Palos Verdes Drive East & Palos Verdes Drive South Roadway Stabilization Project

Palos Verdes Drive East (PVDE) and Palos Verdes Drive South (PVDS), are critical transportation routes within Rancho Palos Verdes. Due to a sensitive location near unstable San Ramon Canyon, there is a strong probability of a catastrophic roadway failure with the potential to take lives, destroy homes, cut off transportation, and limit access to crucial facilities.

#### THE PROBLEM

The erosion of San Ramon Canyon has accelerated at an alarming rate since the 2005 storm events which resulted in a Presidential disaster declaration. Geologists and engineers conclude that the instability translates into probable roadway failure. The Canyon's streambed is now only a mere 86' from one of two hairpin turns on PVDE. Erosion of the bank will cause complete roadway failure; reconstruction will be impossible. **If PVDE is rendered useless, it cannot be reconstructed, severely altering transportation routes for emergency personnel and residents.**

For PVDS, every storm event requires emergency response to keep the road open. In a recent very dry year, emergency response was still necessary eight times to remove silt and debris. **If PVDS collapses, the debris flow will endanger approximately 250 homes and 500 senior residents located roughly 270 feet below San Ramon Canyon. Homes will be destroyed, residents will be at risk, and emergency operations will be severely compromised.**

**Aerial Overview. Erosion conditions are accelerating; roadway failure is probable with reconstruction impossible.**

#### VITAL TRANSPORTATION ROUTES and LIFE SAFETY

PVDE and PVDS are crucial roads for emergency evacuations, emergency service providers, and access to staging areas for regional fire safety personnel. In addition, PVDE and PVDS are essential routes to government facilities and widely used transportation networks.

**Palos Verdes Drive East** is one of only two access roads for a Federal Aviation Administration's communication facility; headquarters for air traffic control computer technology managing some of the most complex airspace in the country.

**Palos Verdes Drive South** is a vital transportation link for local residents and contributes to the overall efficient circulation for through traffic to the Coast Guard facilities at Point Vicente, the Ports of Los Angeles and Long Beach, and Interstate 110.

**The 43,000 residents of Rancho Palos Verdes and the entire population of the Palos Verdes Peninsula depend on PVDE and PVDS for essential transportation and safety needs. Roadway failures would compromise immediate access for fire, police and emergency personnel, greatly increase commute times, destroy two vital transportation links to government facilities, and significantly decrease economic revenue by limiting access to businesses, local attractions and amenities, including world-class resorts.**

#### THE SOLUTION

The Palos Verdes Drives East and Palos Verdes Drive South Roadway Stabilization Project involves planning, engineering, environmental clearance and mitigation, right-of-way acquisition, and construction of significant drainage restoration work to stabilize Palos Verdes Drive East and Palos Verdes Drive South. Total estimated cost of the project is \$19.5 million.

Rancho Palos Verdes • 30940 Hawthorne Blvd. • Rancho Palos Verdes, California • 90275 • (310) 544-5252

# Rancho Palos Verdes, California

## Palos Verdes Drive East & Palos Verdes Drive South Roadway Stabilization Project

### Key Site Features

- 
**San Ramon Canyon.** Instability of Canyon is acceleration at alarming rate. Failure will severely impact local circulation, economy, and emergency response.
- 
**Open space** subject to wildfire hazard. PVDE provides access to critical staging areas for emergency personnel.
- 
**Stabilization Sites.** Stabilize approximately one mile of PVDE. PVDE cannot be reconstructed if Canyon fails. Stabilize approximately 300 feet on PVDS. The two hairpin turns on PVDE are less than 100 feet from the Canyon edge. Actual construction work will occur in San Ramon Canyon
- 
**Federal Aviation Administration** communications center located approximately 2.8 miles north of project site. PVDE is only one of two access points to facility that controls all Southern California airspace.
- 
**Approximately 250 homes** and 500 senior residents are located roughly 270 feet below feet below San Ramon Canyon
- 
**U.S. Coast Guard Facility** located approximately 4.5 miles west of project site.
- 
**Ports of Los Angeles and Long Beach** located approximately 3.5 and 8.4 miles east of the project site, respectively.

## Community Landslide Issues

### *What is Susceptible to Landslides?*

Landslides affect utility services, transportation systems, and critical lifelines. The planning area may suffer immediate damages and loss of service. Disruption of infrastructure, roads, and critical facilities also have a long-term effect on the economy. Utilities, including potable water, wastewater, telecommunications, natural gas, and electric power are all essential to service community needs. Loss of electricity has the most widespread impact on other utilities and on the whole community. Natural gas pipes are also at risk of breakage from landslide movements as small as an inch or two.

Another potential impact affecting the planning area is an earth movement that creeps or slides into a structure or vital open area.

If a structure is identified to be in a landslide area, it does not necessarily mean that the structure will be impacted by a landslide. It means that the structure is considered to be at risk to landslide and depending on other factors may or may not be impacted.

### Impact of Landslides in the Planning Area\*

Landslides and their impacts will vary by location and severity of any given Landslide event and will likely only affect certain areas of the county during specific times. Based on the risk assessment, it is evident that landslides will continue to have potentially devastating economic impacts to certain areas of the planning area. Impacts that are not quantified, but can be anticipated in future events, include:

- ✓ Injury and loss of life
- ✓ Commercial and residential structural damage
- ✓ Disruption of and damage to public infrastructure
- ✓ Secondary health hazards e.g. mold and mildew
- ✓ Damage to roads/bridges resulting in loss of mobility
- ✓ Significant economic impact (jobs, sales, tax revenue) upon the community
- ✓ Negative impact on commercial and residential property values
- ✓ Significant disruption to students and teachers as temporary facilities and relocations would likely be needed

### *Severity*

Historically, landslides triggered by earthquakes are a major cause of earthquake damage. Landslides tied to the 1971 San Fernando, 1989 Loma Prieta, and 1994 Northridge Earthquakes destroyed or damaged numerous homes/structures, blocking major transportation corridors, and damaging life-line infrastructure.

---

#### \* ELEMENT B: HAZARD IDENTIFICATION AND RISK ASSESSMENT | B3

B3. Is there a description of each identified hazard's impact on the community as well as an overall summary of the community's vulnerability for each jurisdiction? (Requirement §201.6(c)(2)(ii))

### *Roads and Bridges*

Losses incurred from landslide hazards in the planning area are often associated with roads. RPV uses a private contractor and RHE uses the Los Angeles County Public Works Department for responding to slides that inhibit the flow of traffic or are damaging a road. They are tasked with responding to slides that inhibit the flow of traffic or are damaging a road or a bridge. The road departments do their best to communicate with residents and businesses impacted by landslides.

It is not cost-effective to mitigate all slides because of limited funds, and because some historical slides are likely to become active again even with mitigation measures. The Cities and County alleviate problem areas by grading slides, and by installing new drainage systems on the slopes to divert water from the landslides. This type of response activity is often the most cost-effective in the short-term, but is only temporary. Unfortunately, many property owners are unaware of slides and the dangers associated with them.

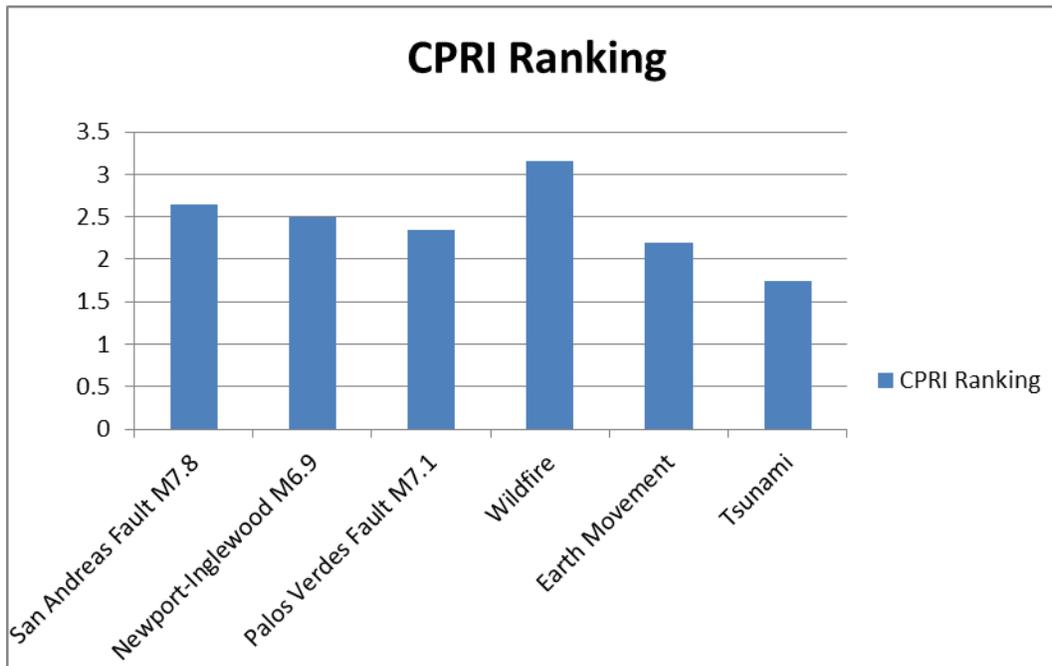

### *Lifelines and Critical Facilities*

Lifelines and critical facilities should remain accessible, if possible, during a natural hazard event. The impact of closed transportation arteries are increased if the closed road or bridge is critical for hospitals and other emergency facilities. Losses of power and phone service are also potential consequences of landslide events. Due to heavy rains, soil erosion in hillside areas can be accelerated, resulting in loss of soil support beneath high voltage transmission towers in hillsides and remote areas. Flood events can also cause landslides, which have serious impact on gas lines that are located in vulnerable soils.

### *Landslide Mitigation Activities*

Landslide mitigation activities include current mitigation programs and activities that are implemented by local or City organizations. (See Mitigation Actions Matrix)

## Section 7: Tsunami Hazards

| Calculated Priority Risk Index (CPRI) |                   |
|---------------------------------------|-------------------|
| Probability:                          | Unlikely          |
| Magnitude/Severity:                   | Limited           |
| Warning Time:                         | Less than 6 hours |
| Duration:                             | Less than 6 hours |

### Why are Tsunamis a Threat to the Planning Area?\*

“Since 1812, the California coast has had 14 tsunamis with wave heights higher than three feet; six of these were destructive. The Channel Islands were hit by a big tsunami in the early 1800s. The worst tsunami resulted from the 1964 Alaskan earthquake and caused 12 deaths and at least \$17 million in damages in northern California.”

History has shown that the probability of a tsunami in the planning area is a relatively low threat and there is not considered to be any threat to the City of RHE given that the City has no coastline.

However, the planning area has 7 ½ miles of coastline in the City of Rancho Palos Verdes. If a tsunami should occur, the consequences would be great. The impact could cause loss of life,

#### \* ELEMENT B: HAZARD IDENTIFICATION AND RISK ASSESSMENT | B2

B2. Does the Plan include information on previous occurrences of hazard events and on the probability of future hazard events for each jurisdiction? (Requirement §201.6(c)(2)(i))

destroy many high priced homes along the bluffs and greatly affect City’s many coastal public parks and commercial businesses, such as the Trump National Golf Club and the Terranea Resort. Even if all residents and visitors were safely evacuated, the damage to property would still be tremendous. Fortunately, the planning area has yet to be significantly impacted by a Tsunami event.

### *Impact of Tsunamis in the Planning Area\**

Based on the risk assessment, it is evident that tsunamis will continue to have potentially devastating economic impacts to certain areas of the planning area. Impacts that are not quantified, but can be anticipated in future events, include:

- ✓ Injury and loss of life
- ✓ Disruption of and damage to district infrastructure
- ✓ Secondary health hazards e.g. mold and mildew
- ✓ Significant economic impact (jobs, sales, tax revenue) upon the staff and students
- ✓ Significant disruption to students and teachers as temporary facilities and relocations would likely be needed

## What are Tsunamis?

The phenomenon we call “tsunami” (soo-NAH-mee) is a series of traveling ocean waves of extremely long length generated primarily by earthquakes occurring below or near the ocean floor. Underwater volcanic eruptions and landslides can also generate tsunamis. In the deep ocean, the tsunami waves move across the deep ocean with a speed exceeding 500 miles per hour, and a wave height of only a few inches. Tsunami waves are distinguished from ordinary ocean waves by their great length between wave crests, often exceeding 60 miles in length or more, and time between these crests, ranging from 10 minutes to an hour.

As they reach the shallow waters of the coast, the waves slow down and the water can pile up into a wall of destruction up to 30 feet or more in height. The effect can be amplified where a bay, harbor or lagoon funnels the wave as it moves inland. Large tsunamis have been known to rise over 100 feet. Even a tsunami 1-3 feet high can be very destructive and cause many deaths and injuries.

Tsunamis typically are classified as either local or distant. Tsunamis from local sources usually result from earthquakes occurring off nearby coasts. Tsunamis from distant sources are the most common type observed along the California Coast. Tsunamis generated by earthquakes in South America and the Aleutian-Alaskan region have posed a greater hazard to the West Coast of the United States than locally generated tsunamis. There is a history of Pacific-wide tsunamis occurring every 10 to 20 years. (Source: TyCom EIR, 9/2001)

---

**\* ELEMENT B: HAZARD IDENTIFICATION AND RISK ASSESSMENT | B3**  
 B3. Is there a description of each identified hazard’s impact on the community as well as an overall summary of the community’s vulnerability for each jurisdiction? (Requirement §201.6(c)(2)(ii))

## What causes Tsunami?

There are many causes of tsunamis but the most prevalent is earthquakes. In addition, landslides, volcanic eruptions, explosions, and even the impact of cosmic bodies, such as meteorites, can generate tsunamis.

### *Plate Tectonics*

Plate Tectonic Theory is based on an earth model characterized by a small number of lithospheric plates, 40 to 150 miles thick that float on a viscous under-layer called the asthenosphere. These plates, which cover the entire surface of the earth and contain both the continents and sea floor, move relative to each other at rates of up to several inches per year. The region where two plates come in contact is called a plate boundary, and the way in which one plate moves relative to another determines the type of boundary. The types of movement that creates a boundary is: 1) spreading, where the two plates move away from each other; 2) subduction, where the two plates move toward each other and one slides beneath the other; and 3) transform, where the two plates slide horizontally past each other. Subduction zones are characterized by deep ocean trenches, and the volcanic islands or volcanic mountain chains associated with the many subduction zones around the Pacific Rim are sometimes called the Ring of Fire. (Source: [http://www.prh.noaa.gov/itic/library/about\\_tsu/faqs.html](http://www.prh.noaa.gov/itic/library/about_tsu/faqs.html) - 1)

### *Earthquakes and Tsunamis*

An earthquake can be caused by volcanic activity, but most are generated by movements along fault zones associated with the plate boundaries. Most strong earthquakes, representing 80% of the total energy released worldwide by earthquakes, occur in subduction zones where an oceanic plate slides under a continental plate or another younger oceanic plate.

Not all earthquakes generate tsunamis. To generate a tsunami, the fault where the earthquake occurs must be underneath or near the ocean, and cause vertical movement of the sea floor over a large area, hundreds or thousands of square miles. "By far, the most destructive tsunamis are generated from large, shallow earthquakes with an epicenter or fault line near or on the ocean floor." (Source: [http://www.prh.noaa.gov/itic/library/about\\_tsu/faqs.html#1](http://www.prh.noaa.gov/itic/library/about_tsu/faqs.html#1)) The amount of vertical and horizontal motion of the sea floor, the area over which it occurs, the simultaneous occurrence of slumping of underwater sediments due to the shaking, and the efficiency with which energy is transferred from the earth's crust to the ocean water are all part of the tsunami generation mechanism. The sudden vertical displacements over such large areas, disturb the ocean's surface, displace water, and generate destructive tsunami waves. (Source: [http://www.prh.noaa.gov/itic/library/about\\_tsu/faqs.html#1](http://www.prh.noaa.gov/itic/library/about_tsu/faqs.html#1))

Although all oceanic regions of the world can experience tsunamis, the most destructive and repeated occurrences of tsunamis are in the Pacific Rim region.

## Tsunami Earthquakes

In 1960, a large tsunami caused widespread death and destruction throughout the Pacific was generated by an earthquake located off the coast of Chile. It caused loss of life and property damage not only along the Chile coast but also in Hawaii and as far away as Japan. The Great Alaskan Earthquake of 1964 killed 106 people and produced deadly tsunami waves in Alaska, Oregon and California.

The September 2, 1992 Masachapa Nicaragua Earthquake (M7.2) was barely felt by residents along the coast of Nicaragua. Located well off-shore, the severity of shaking on a scale of I to XII, was mostly II along the coast, and reached III at only a few places. Twenty to 70 minutes after the earthquake occurred, a tsunami struck the coast of Nicaragua with wave amplitudes up to 13 feet above normal sea level in most places and a maximum run-up height of 35 ft. The waves caught coastal residents by complete surprise and caused many casualties and considerable property damage.

This tsunami was caused by a tsunami earthquake, an earthquake that produces an unusually large tsunami relative to the earthquake magnitude. Tsunami earthquakes are characterized by a very shallow focus, fault dislocations greater than several meters, and fault surfaces that are smaller than for a normal earthquake.

Tsunami earthquakes are also slow earthquakes, with slippage along the fault beneath the sea floor occurring more slowly than it would in a normal earthquake. The only known method to quickly recognize a tsunami earthquake is to estimate a parameter called the seismic moment using very long period seismic waves (more than 50 seconds/cycle). Two other destructive and deadly tsunamis from tsunami earthquakes have occurred in recent years in Java, Indonesia (June 2, 1994) and Peru (February 21, 1996).

“Less frequently, tsunami waves can be generated from displacements of water resulting from rock falls, icefalls and sudden submarine landslides or slumps. Such events may be caused impulsively from the instability and sudden failure of submarine slopes, which are sometimes triggered by the ground motions of a strong earthquake. For example in the 1980's, earth moving and construction work of an airport runway along the coast of Southern France, triggered an underwater landslide, which generated destructive tsunami waves in the harbor of Thebes.” (Source: [http://www.prh.noaa.gov/itic/library/about\\_tsu/faqs.html#1](http://www.prh.noaa.gov/itic/library/about_tsu/faqs.html#1))

In July 1993, a tsunami generated in the Sea of Japan killed over 120 people in Japan. Damage also occurred in Korea and Russia but spared other countries since the tsunami wave energy was confined within the Sea of Japan. The 1993 Japan Sea tsunami is known as a “regional event” since its impact was confined to a relatively small area. For people living along the northwestern coast of Japan, the tsunami waves followed the earthquake within a few minutes.

During the 1990's, destructive regional tsunamis also occurred in Nicaragua, Indonesia, the Philippines, Papua New Guinea, and Peru, killing thousands of people. Others caused property damage in Chile and Mexico. Some damage also occurred in the far field in the Marquesas Islands (French Polynesia) from the July 30, 1995, Chilean and February 21, 1996, Peruvian tsunamis.

On December 26, 2004 the second biggest earthquake in recorded history occurred off the coast of Indonesia. The Magnitude 9.3 earthquake unleashed a devastating tsunami that travelled thousands of kilometers across the Indian Ocean, taking the lives of nearly 230,000 people in countries as far apart as Indonesia, the Maldives, Sri Lanka and Somalia.

The 2011 earthquake off the Pacific coast of Tōhoku, also known as the 2011 Tōhoku Earthquake, the Great East Japan Earthquake, (Japanese: "Eastern Japan Great Earthquake Disaster") was a M9.0 (Mw) undersea megathrust earthquake off the coast of Japan that

occurred at 14:46 JST (05:46 UTC) on Friday, March 11, 2011, with the epicenter approximately 70 kilometers (43 mi) east of the Oshika Peninsula of Tōhoku and the hypocenter at an underwater depth of approximately 32 km (20 mi). It was the most powerful known earthquake to have hit Japan, and one of the five most powerful earthquakes in the world overall since modern record-keeping began in 1900. It was so powerful the island of Honshu was moved 8 feet eastward. The earthquake triggered extremely destructive tsunami waves of up to 40.5 meters (133 ft) in Miyako, Iwate, and Tōhoku. In some cases traveling up to 10 km (6 mi) inland. In addition to loss of life and destruction of infrastructure, the tsunami caused a number of nuclear accidents, primarily the ongoing level 7 meltdowns at three reactors in the Fukushima I Nuclear Power Plant complex, and the associated evacuation zones affecting hundreds of thousands of residents.

The Japanese National Police Agency has confirmed 15,719 deaths, 5,718 injured, and 4,616 people missing across eighteen prefectures, as well as over 125,000 buildings damaged or destroyed.

## Tsunami Characteristics

### *How Fast?*

Unnoticed tsunami waves can travel at the speed of a commercial jet plane, over 500 miles per hour. They can move from one side of the Pacific Ocean to the other in less than a day. This great speed makes it important to be aware of the tsunami as soon as it is generated.

Scientists can predict when a tsunami will arrive at various places by knowing the source characteristics of the earthquake that generated the tsunami and the characteristics of the sea floor along the paths to those places. Tsunamis travel much slower in more shallow coastal waters where their wave heights begin to increase dramatically.

### *How Big?*

Offshore and coastal features can determine the size and impact of tsunami waves. Reefs, bays, entrances to rivers, undersea features, and the slope of the beach all help to modify the tsunami as it attacks the coastline. When the tsunami reaches the coast and moves inland, the water level can rise many feet. In extreme cases, water level has risen to more than 50 feet for tsunamis of distant origin and over 100 feet for tsunami waves generated near the earthquake's epicenter. The first wave may not be the largest in the series of waves. One coastal community may see no damaging wave activity while in another nearby community destructive waves can be large and violent. The flooding can extend inland by 1,000 feet or more, covering large expanses of land with water and debris.

### *How Frequent?*

Since scientists cannot predict when earthquakes will occur, they cannot determine exactly when a tsunami will be generated. However, by looking at past historical tsunamis and run-up maps, scientists know where tsunamis are most likely to be generated. Past tsunami height measurements are useful in predicting future tsunami impact and flooding limits at specific coastal locations and communities.

### *Severity*

A major tsunami occurring near the planning area could cause deaths and injuries, extensive property damage, fires, hazardous material spills, and other dangers for properties within a mile of the coastline.

The time of day and season of the year would have a profound impact on the number of dead and injured and the amount of property damage to the region as a whole. Support of damage control and disaster relief could be required from other local governments and private organizations, as well as the state and federal governments.

## Types of Tsunamis

### *Pacific-Wide and Regional Tsunamis*

Tsunamis can be categorized as “local” and “Pacific-Wide.” Typically, a Pacific-Wide tsunami is generated by major vertical ocean bottom movement in offshore deep trenches. A “local” tsunami can be a component of the Pacific-Wide tsunami in the area of the earthquake or a wave that is confined to the area of generation within a bay or harbor and caused by movement of the bay itself or landslides.

In less than a day, tsunamis can travel from one side of the Pacific to the other. However, people living near areas where large earthquakes occur may find that the tsunami waves will reach their shores within minutes of the earthquake. For these reasons, the tsunami threat to many areas such as Alaska, the Philippines, Japan and the United States West Coast can be immediate (for tsunamis from nearby earthquakes which take only a few minutes to reach coastal areas) or less urgent (for tsunamis from distant earthquakes which take from three to 22 hours to reach coastal areas).

## History of Regional Tsunamis

### *Local*

A local tsunami may be the most serious threat as it strikes suddenly, sometimes before the earthquake shaking stops. Alaska has had six serious local tsunamis in the last 80 years and Japan has had many more.

### *Local History of Tsunamis*

Tsunamis have been reported since ancient times. They have been documented extensively in California since 1806. Although the majority of tsunamis have occurred in Northern California, Southern California has been impacted as well. In the 1930’s, four tsunamis struck the Los Angeles County, Orange County, and San Diego County coastal areas. In Orange County the

tsunami wave reached heights of 20 feet or more above sea level. In 1964, following the Alaska Earthquake (Magnitude 8.2), tidal surges of approximately 4 feet to 5 feet hit the Huntington Harbor area causing moderate damage.

**Table 7-1: Tsunami Events in California 1930-2012**  
 (Source: Worldwide Tsunami Database, [www.ngdc.noaa.gov](http://www.ngdc.noaa.gov))

| Date       | Location       | Maximum Run-up*(meters) | Earthquake Magnitude |
|------------|----------------|-------------------------|----------------------|
| 08/31/1930 | Redondo Beach  | 6.10                    | 5.2                  |
| 08/31/1930 | Santa Monica   | 6.10                    | 5.2                  |
| 08/31/1930 | Venice         | 6.10                    | 5.2                  |
| 03/11/1933 | La Jolla       | 0.10                    | 6.3                  |
| 03/11/1933 | Long Beach     | 0.10                    | 6.3                  |
| 08/21/1934 | Newport Beach  | 12.00                   | Unknown              |
| 02/09/1941 | San Diego      | Unknown                 | 6.6                  |
| 10/18/1989 | Monterey       | 0.40                    | 7.1                  |
| 10/18/1989 | Moss Landing   | 1.00                    | 7.1                  |
| 10/18/1989 | Santa Cruz     | 0.10                    | 7.1                  |
| 04/25/1992 | Arena Cove     | 0.10                    | 7.1                  |
| 04/25/1992 | Monterey       | 0.10                    | 7.1                  |
| 09/01/1994 | Crescent City  | 0.14                    | 7.1                  |
| 11/04/2000 | Point Arguello | 5.00                    | Unknown              |
| 6/15/2005  | N. California  | 0.10                    | 7.2                  |

\* Maximum Run-up (meters) -The maximum water height above sea level. The Run-up is the height the tsunami reached above a reference level such as mean sea level. It is not always clear which reference level was used.

## Tsunami Hazard Assessment

### *Hazard Identification*

The tsunami threat to the planning area is considered low. Although the risk is considered low, the impacts could be high.

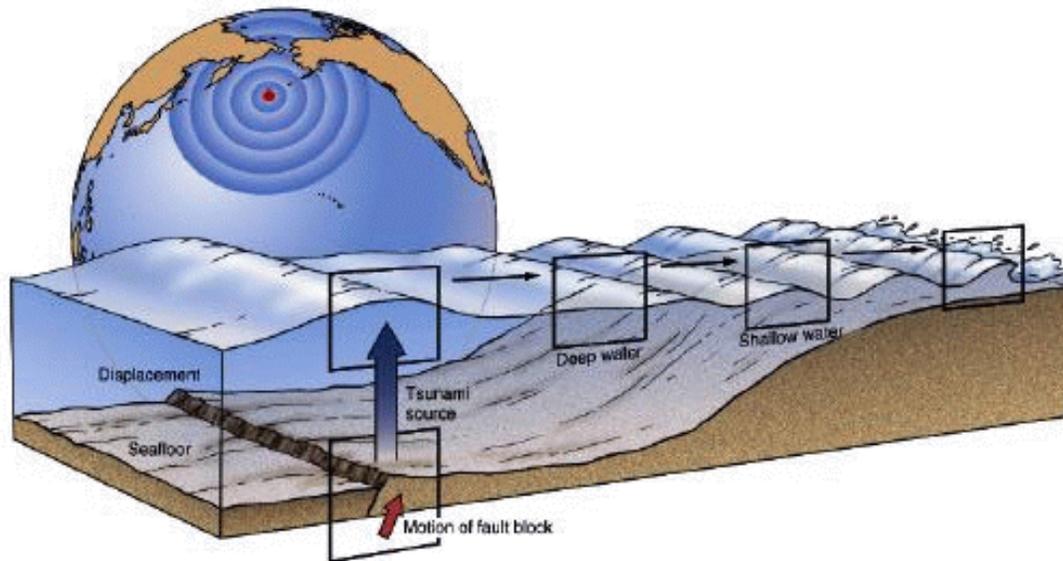

### *Damage Factors of Tsunamis*

Tsunamis cause damage in three ways: 1) inundation, 2) wave impact on structures, and 3) erosion.

“Strong, tsunami-induced currents lead to the erosion of foundations and the collapse of bridges and sea walls. Flotation and drag forces move houses and overturn railroad cars. Considerable damage is caused by the resultant floating debris, including boats and cars that become dangerous projectiles that may crash into buildings, break power lines, and may start fires. Fires from damaged ships in ports or from ruptured coastal oil storage tanks and refinery facilities can

cause damage greater than that inflicted directly by the tsunami. Of increasing concern is the potential effect of tsunami draw down, when receding waters uncover cooling water intakes of nuclear power plants.” (Source: [http://www.prh.noaa.gov/itic/library/about\\_tsu/faqs.html#1](http://www.prh.noaa.gov/itic/library/about_tsu/faqs.html#1))

Figure 7-1: Tsunami Formation

Tsunamis are due to large off-shore earthquakes and ocean landslides. Dangerous tsunamis would most likely originate in the Aleutian and Chilean offshore submarine trenches. The planning area’s vulnerable properties have a west-southwest facing orientation that may be vulnerable to tsunamis or tidal surges from the south and from the west.

### *Landslides*

Although less common worldwide, tsunami waves can be generated from the displacement of water resulting from rock falls, icefall, and sudden submarine landslides. These types of events may be caused spontaneously from the instability and sudden failure of submarine slopes. The ground motions of a strong earthquake can also sometimes trigger them. In the 1980's, earth moving and construction work of an airport runway along the coast of Southern France, triggered an underwater landslide, which generated destructive tsunami waves in the harbor of Thebes, Egypt.

According to the Rancho Palos Verdes General Plan, the Palos Verdes Peninsula was uplifted above sea level by movement on two sub-parallel bounding faults, the Palos Verdes Fault on the northeast and the San Pedro Fault offshore on the southwest. Similar geologic phenomenon created the Channel Islands that lie offshore from the Peninsula. Submarine topographic mapping of the San Pedro Channel and Redondo Beach Trench have revealed that, similar to the marine terraces that form the Peninsula, there are a series of steep slopes between the Peninsula coastline and Catalina Island. Similar to the ancient landslides that have been documented on the Peninsula, some of these slopes show evidence of failure. Therefore, it is conceivable that a local tsunami could be generated by an underwater landslide or avalanche.

## Tsunami Watches and Warnings

### *Warning System*

The tsunami warning system in the United States is a function of the National Oceanic and Atmospheric Administration's (NOAA) National Weather Service. Development of the tsunami warning system was impelled by the disastrous waves generated in the 1964 Alaska Tsunami, which surprised Hawaii and the U.S. West Coast, taking a heavy toll in life and property.

The disastrous 1964 tsunami resulted in the development of a regional warning system in Alaska. The Alaska Tsunami Warning Center (ATWC) is in Palmer, Alaska. This facility is the nerve center for an elaborate telemetry network of remote seismic stations in Alaska, Washington, California, Colorado, and other locations. Tidal data is also telemetered directly to the ATWC from eight Alaskan locations. Tidal data from Canada, Washington, Oregon, and California are available via telephone, teletype, and computer readout.

### *Notification*

The National Warning System (NAWAS) is an integral part of the Alaska Tsunami Warning Center. Reports of major earthquakes occurring anywhere in the Pacific Basin that may generate seismic sea waves are transmitted to the Honolulu Observatory for evaluation. An Alaska Tsunami Warning Center is also in place for public notification of earthquakes in the Pacific Basin near Alaska, Canada, and Northern California. The Observatory Staff determines action to be taken and relays warnings over the NAWAS circuits to inform and warn West Coast states. The State NAWAS circuit is used to relay the information to the Orange County Operational Area warning center which will in turn relay the information to local warning points in coastal areas. The same information is also transmitted to local jurisdictions over appropriate radio systems, teletype, and telephone circuits to ensure maximum dissemination.

Los Angeles County will use the Emergency Alert System (EAS) to warn the public of an anticipated tsunami.

A Tsunami Watch Bulletin is issued if an earthquake has occurred in the Pacific Basin and could cause a tsunami. A Tsunami Warning Bulletin is issued when an earthquake has occurred and a tsunami is spreading across the Pacific Ocean. When a threat no longer exists, a Cancellation Bulletin is issued.

### *Vulnerability and Risk*

With an analysis of tsunami events depicted in the "Local History" section, it can be deduced that a tsunami would significantly impact life, property, infrastructure and transportation.

## Community Tsunami Issues

### *What is Susceptible to Tsunami?*

As shown on Maps 7-1 through 7-3 the greatest vulnerability to tsunamis are properties located near the coastline of Rancho Palos Verdes.

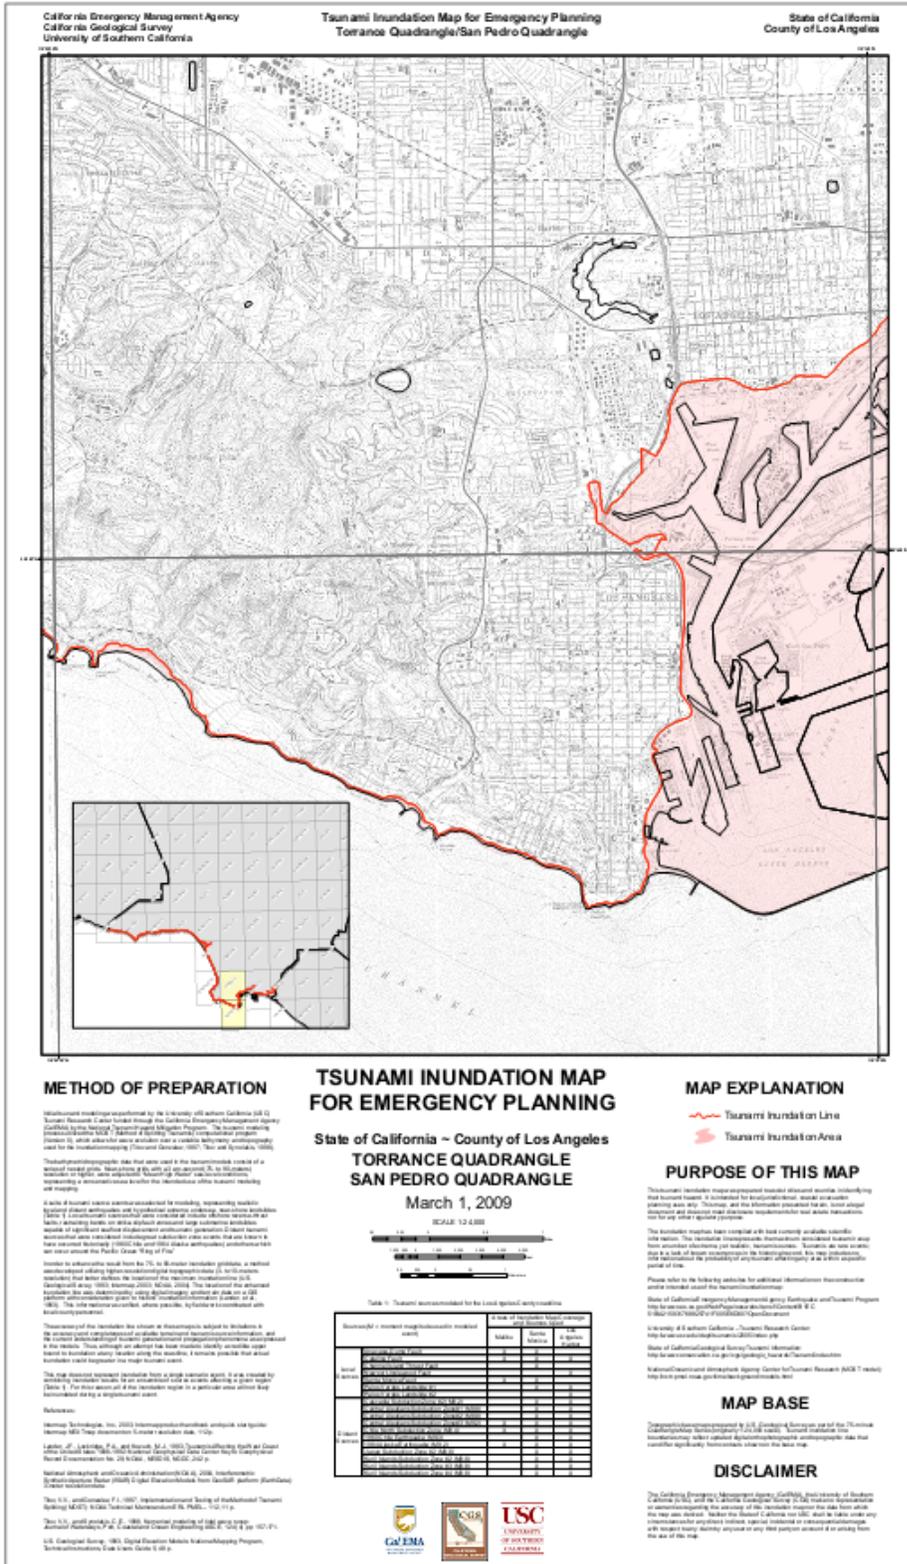

Tsunami “maximum run-up” projections were modeled by the University of Southern California and distributed by the California Office of Emergency Services for the purposes of identifying tsunami hazards. The tsunami model was the result of a combination of inundation modeling and onsite surveys and shows maximum projected inundation levels from tsunamis along the entire coast of Los Angeles County. The maximum run-up for the maps below is approximately 42 feet. This means that based on the scenario tsunami, the displaced water level would be approximately 42 feet above the normal tide for that day and time.

**Map 7-3: Tsunami Inundation Map – Torrance/San Pedro Quadrangle**  
 (Source: State of California Department of Conservation)

### *Life and Property*

Considering the “local” history events of tsunamis and the predicted wave heights from a landslide induced tsunami in the San Pedro Channel, it can be concluded that the area seaward of Palos Verdes Drive South and Palos Verdes Drive West in the City of Rancho Palos Verdes would be heavily impacted by a tsunami event. According to the RPV Coastal Specific Plan (December 1978), this area contains 903 acres and represents approximately 10% of the City’s land area. The largest impact on the community from a tsunami event would be from loss of life and property.

### *Residential*

Residential property along the coast could also be devastated. City of Rancho Palos Verdes is an affluent community with expensive homes, especially for those located in the highly desirable area along the coastline. A large tsunami could potentially destroy or damage hundreds of homes situated along the bluff tops and spread debris throughout the coastal zone. Any residential structure with weak reinforcement would be susceptible to damage or could be impacted by significant coastal erosion.

### *Commercial*

Throughout the year the coastline attracts a large number of visitors to the Trump National Golf Club. The Long Point property also consists of a 450-room resort hotel with conference center, spa and golf academy. Currently, the site is a popular location for large weddings and banquets and is frequently used for large-scale commercial filming. A tsunami event would impact these businesses by damaging property and by interrupting business and services. Any commercial structure with weak reinforcement would be susceptible to damage or could be impacted by significant coastal erosion.

### *Recreational*

The Peninsula’s picturesque coastline and marine resources is a public treasure. During the summer months, the City of Rancho Palos Verdes attracts a large number of visitors to its coastal parks and beaches. The City owns approximately 376 acres of parkland seaward of Palos Verdes Drive South and West. The types of development on these public parklands range in intensity from bluff top hiking trails to a regional interpretive museum. In addition, the City’s offshore areas are popular for many types of marine recreational activities, including sun bathing, scuba diving, surfing, kayaking, fishing and sailing. If a tsunami were to occur on a peak holiday weekend, of example, it could devastate the entire coastal area and result in a significant loss of life.

### *Infrastructure*

Tsunamis (and earthquakes) can damage buildings, power lines, and other property and infrastructure due to flooding. Tsunamis can result in collapsed or damaged buildings or blocked roads and bridges, damaged traffic signals, streetlights, and parks, among others. Damage to public water and sewer systems, transportation networks, and flood channels would greatly impact daily life for residents.

Roads blocked by objects during a tsunami may have severe consequences to people who are attempting to evacuate or who need emergency services. Emergency response operations can be complicated when roads are blocked or when power supplies are interrupted. Industry and

commerce can suffer losses from interruptions in electric services and from extended road closures. They can also sustain direct losses to buildings, personnel, and other vital equipment. There are direct consequences to the local economy resulting from tsunamis related to both physical damages and interrupted services.

## Section 8: Technological and Human-caused Hazards

*The following information is provided for educational purposes. Based on the Risk Assessment conducted by the Planning Team, Technological and Human-Caused Hazards were deemed to pose a “low” threat to the Planning Area. The following descriptions provide a general hazard identification, impacts from the hazards, and a brief discussion on local conditions.*

### Hazardous Materials Release

#### *Hazard Identification*

Virtually all sectors of the region’s economy use materials that, if improperly stored, handled, transported, or disposed of, can create public health and environmental risks. Definitions of hazardous materials vary from source to source. The current descriptions used in Federal and State legislation include:

- A hazardous material is one that is ignitable, reactive, corrosive, toxic, or any combination of these properties (Resource Conservation and Recovery Act).
- A hazardous material is a substance or combination of substances which, because of its quantity, concentration or physical, chemical, or infectious characteristics may:
  - Cause, or significantly contribute to an increase in mortality or an increase in serious irreversible or incapacitating reversible illness; or
  - Pose a substantial present or potential hazard to humans or the environment (State Health and Safety Code, Chapter 6.5).
- A hazardous material is an injurious substance, including pesticides, herbicides, toxic metals and chemicals, liquefied material gas, explosives, volatile chemicals, and nuclear fuels (California Government Code).

Hazardous materials are typically stored in secured, on-site areas, in small containers or large aboveground or underground storage tanks.

Hazardous materials are transported throughout the region on a daily basis. The California Highway Patrol has designated the County’s interstate system as hazardous materials transportation corridors; however surface streets are also used to transport hazardous materials from suppliers to customers. The California Highway Patrol is the primary regulatory authority for intrastate transport of hazardous materials.

The Federal Department of Transportation (DOT) is the primary regulatory authority for interstate transport of hazardous materials. DOT regulations establish criteria for safe handling procedures (e.g., packaging, marking, labeling, and routing). Criteria also exist regarding personnel qualifications, inspections, and equipment specifications.

Weather has many complex and important effects on the impact of hazardous material incidents. For instance, as wind increases in velocity, the plume or emissions from the incident increases. Likewise, precipitation (annual total, seasonal distribution and storm intensity) may increase the spread of hazardous materials. Both wind and precipitation may compound health concerns related to degraded air or water quality.

## Impacts

Hazardous material incidents might conceivably cause the following issues:

- Potential for fires and explosions
- Disruption of transportation systems
- Need for highly specialized responders
- Destruction of utilities and other public services
- Damage to public infrastructure and facilities
- Residential displacement, including evacuations
- Individuals trapped and injured in unsafe conditions
- Health issues related to discharges or releases
- Need for emergency food, shelter, and medical care
- Economic impacts, both short and long-term
- Water pollution and quality degradation

### *Local Conditions*

RPV/RHE does not have any heavy industry, which effectively limits the quantity of hazardous materials located in the Planning Area. The following locations, however, could subject the Planning Area to significant hazardous materials incidents:

1. Kaiser Medical Hospital – located along the Planning Area’s north-eastern boundary
2. Pacific Coast Highway – arterial highway; potential transportation incidents
3. Interstate 110 – located east of the Planning Area; potential transportation incidents
4. Ports – Port of Los Angeles and Port of Long Beach; potential hazardous materials/terrorism/transportation incidents
5. Oil Refineries – located on Lomita Blvd; potential hazardous materials incident
6. LAX Airport – located north of the Planning Area; potential hazardous materials/terrorism/transportation incidents

The Planning Area is characterized by year-round mild to warm temperatures and light winds. The dominant wind pattern is daytime, offshore breezes from the northwest, occasionally broken by very strong Santa Ana winds from the northeasterly direction, resulting in wind velocities of up to 70 miles per hour. The Santa Ana winds typically occur during the autumn and winter months.

The predominant offshore breezes could assist in the dispersal of airborne pollutants; however an inversion layer of warm air occasionally overlaps the offshore breezes and may trap pollutants, particularly during the summer months. This phenomenon may compound health concerns related to degraded air quality.

## Civil Disturbance

### *Hazard Identification*

The spontaneous disruption of normal, orderly conduct and activities in urban areas, or the outbreak of rioting or violence that is of a large nature, is referred to as a civil disturbance. Civil disturbance can be spurred by specific events or can be the result of long-term displeasure with authority. Civil disturbance is usually distinguished by the need for outside assistance from law enforcement and/or fire services.

Civil disturbance may be precipitated or manifested in a number of ways, including but not limited to the following:

- Spontaneous reactions to verdicts in high-profile trials
- Spontaneous reactions to organized sporting event outcomes
- Organized reactions or demonstrations
- Targeting of public facilities
- Targeting of private highly visible establishments
- Local population demonstrations
- Transient population demonstrations
- Hit and run tactics
- Diversion tactics masking other motives
- Indiscriminate acts of arson and vandalism

While the motivation behind civil disturbance may be known, the exact extent and type of activity that will occur is less certain. During an outbreak of civil disturbance, the potential for multiple incidents is very high.

### **Impacts**

- Significant injuries and deaths
- Potential for fires and explosions
- Potential for looting and theft
- Disruption of transportation systems
- Looting and widespread property theft
- Interference with law enforcement activities
- Destruction of utilities and other public services
- Damage to public infrastructure and facilities
- Residential displacement, including evacuations
- Individuals trapped and injured in unsafe conditions
- Need for emergency food, shelter, and medical care
- Economic impacts, both short and long-term

The threat to law enforcement and other responding personnel can be severe and bold in nature, due to the fervor and defiance of authority that typically accompanies acts of civil disturbance. Securing of critical infrastructure and services is necessary and may include a need for law enforcement escorts for maintenance and inspection crews.

**Table 8-1: History of Civil Disturbances in Los Angeles County**

| Disturbance      | Location                  | Date | Deaths | Injuries | Damage       |
|------------------|---------------------------|------|--------|----------|--------------|
| Occupy Movement  | Port of Long Beach        | 2011 | 0      | 0        | N/A          |
| Rodney King Riot | City of Los Angeles       | 1992 | 53     | 2300     | N/A          |
| Watts            | South Central Los Angeles | 1965 | 32     | 874      | \$45 million |

### **Occupy Movement (2011)**

The following is an excerpt from the Occupy Orange County ([www.occupyorangecounty.com](http://www.occupyorangecounty.com)) website: “We are leaderless resistance movement in solidarity with Occupy Wall Street with people of many colors, genders and political persuasions. The one thing we all have in common is that We Are The 99% that will no longer tolerate the greed and corruption of the 1%. We are using the revolutionary Arab Spring tactic to achieve our ends and encourage the use of nonviolence to maximize the safety of all participants. We are in solidarity with the declaration made by Occupy Wall Street.

Our representation in government has been high jacked by those with the means to buy it from government officials. Our elected representatives should implement policies in support of the people instead of the powerful. The people must flex their power by punishing greedy and corrupt corporations and bankers with boycotts. The people should support businesses which conduct themselves with ethical integrity instead. The people must become informed and vote for government officials who are concerned with making real change instead of just being another cog in the greed machine. We are Occupy Orange County and we are committed to seeing change become reality. Join us and help us develop concrete steps towards solving the many problems we face.

We are the 99% and we DO exist in Orange County.”

### **Rodney King Riot (1992)**

On April 29, 1992, following the not guilty verdicts of four Los Angeles Police Officers accused of beating motorist Rodney King, violence erupted at the intersection of Florence and Normandie in South Los Angeles. At the same time, individuals at the corner of 67th Street and 11th Avenue were revolting against passer-bys and motorists. Black residents were outraged that four LAPD officers received not guilty verdicts from an all-white jury in Simi Valley, despite the videotape evidence of the beating of Rodney King, and the testimonial by veteran police officers on behalf of the prosecution. From April 29, 1992 at approximately 3:30 p.m. until May 1st, the violence raged on. The National Guard were called in to bring calm to the City, and by Friday afternoon the violence and looting were subdued. The most violent urban revolt that the United States had ever experienced in the twentieth century resulted in 52 deaths, 2,499 injuries, 6,559 arrests, 1,120 building damaged, 2,314 stores damaged and close to 1 billion in damages.

If we go back to 1992 and examine the precipitating factor of the riot, economics actually played a small role influencing the revolt. Yes, there was a recession in Los Angeles and around the country, unemployment was at an all-time high, high levels of poverty probably exacerbated the

riots that took place, but the critical events and underlying factors to the revolt were the beating of Rodney King in 1991, the probation sentence handed down on Sun Ja Doo, a Korean store clerk that shot Latasha Harlins, a 15 year old black girl, in the back of the head after a dispute over orange juice, and the acquittal of the four LAPD officers. In the Sun Ja Doo incident the jury came back with a second-degree murder conviction, but Judge Joyce Karlin, a white woman, did the unheard of when she sentenced Doo to five years probation. This is what I believe paved the way for the worst urban riot in contemporary history and the fact that over 50% of the damaged or destroyed property was Korean owned was no accident, and is the reason why many characterize this event as an uprising or a revolt. Although many of the images captured certainly show those acting as opportunists taking advantage of an unfortunate situation, at the same time there was an organized attack against Korean establishments within South LA and outside of the black community along Vermont and Western Avenues, north of the black community. Relations between blacks and Koreans in Los Angeles have often been full of tension and there is housing evidence that suggests that those tensions are still present in 2002.

The critical factors that influenced the events of April 29, 1992 all took place within the criminal justice sector of society with the police department central to the events. This is where he must look to address the question of a potential third Los Angeles riot. Chief Daryl Gates was held accountable for the type of relationship that was created between the police and minority communities in South LA and his response to the first day of the riot was considered dismal. Also let us not forget history, when in 1965 people took to the streets of Los Angeles in protest the day following alleged police abuses after the arrest of a Marquette Frye on 116th Street and Avalon. Chief William Parker was also highly criticized for the sharp divide that was created between the black community and the militaristic police, and resentment towards the police grew worse every year since Parker took over as Chief in 1950 up until the violence erupted in 1965. One indication of the increasing tension between the police and the community was the number of complaints that blacks filed between 1950 and 1965. Parker claimed no responsibility during a commission and when asked what sparked the riot he replied "someone threw a rock, and like monkeys in a zoo, they all started throwing rocks."

All of the seven race riots of 1964 were also sparked by an incident of police misconduct. The Otto Kerner Commission of 1968 stated that police actions led to outbreaks in half of the cases studied and those that believe that another revolt will take place will need to examine law enforcement and the criminal justice system. If the LAPD or LASD engage in any inappropriate activity such as excessive force or unlawful officer involved shootings, an outbreak of violence is definitely possible. Let us not forget what happened in Cincinnati in April 2001 when the shooting death of Timothy Thomas, 19, whose death touched off three days of riots. Cincinnati police officer Steven Roach was later found not guilty of negligent homicide in the shooting, but these are the types of events that will determine if Los Angeles will see part three. Under Bernard Parks inappropriate activity from the rank and file was highly unlikely with the disciplinary system that he had in place, but the actions of the next police chief may determine if what happened in 1965 and 1992 will occur again.

### **Watts Riot (1965)**

The Watts Riot began on August 11, 1965 in Los Angeles, California when the Los Angeles Police pulled over Marquette Frye, whom they suspected of driving drunk. While police questioned Frye and his brother, a group of people began to gather around the scene. A struggle ensued shortly after Frye's mother Rena arrived on the scene, resulting in the arrest of all three family members. Police used their batons to subdue Frye and his brother, angering the growing crowd. Shortly after police left, tensions boiled over and the rioting began. What

followed was six days of rioting that claimed the lives of 34 people, injured 1,100 and caused estimated \$100 million dollars damage.

One of the few structures in Watts that remained untouched by the damage was the Watts Towers, a group of tall steel sculptures constructed by Italian immigrant Sam Rodia (often erroneously called Simon Rodia).

### *Local Conditions*

While there is no history of civil disturbance in the Planning Area, the Planning Team recognizes that there is a low possibility of civil disturbance in the future. As an example, it is conceivable that social protests could occur in the geographic vicinity of the oil refineries to the north of the Planning Area.

## Terrorism

### *Hazard Identification*

The United States Department of Justice defines terrorism as “the unlawful use of force or violence committed by a group or individual against persons or property to intimidate or coerce a government, the civilian population, or any segment thereof, in furtherance of political or social objectives.”

Weapons of Mass Destruction (WMDs) are defined in Federal Government Code as any “explosive, incendiary, or poison gas, bomb, grenade, rocket having a propellant charge of more than four ounces, missile having an explosive or incendiary charge of more than one quarter ounce, mine or device similar to the above; poison gas; any weapon involving a disaster organism; or any weapon that is designed to release radiation or radioactivity at a level dangerous to human life.” WMDs are usually classified according to the acronym C-B-R-N-E, or Chemical, Biological, Radiological, Nuclear, Explosive.

**Chemical:** Chemical agents are poisonous vapors, aerosols, liquids, and solids that have toxic effects on people, animals, or plants. They can be released by bombs or sprayed from aircraft, boats, and vehicles. They can be used as a liquid to create a hazard to people and the environment. Some chemical agents may be odorless and tasteless. They can have an immediate effect (a few seconds to a few minutes) or a delayed effect (two to 48 hours). While potentially lethal, chemical agents are difficult to produce and deliver in lethal concentrations. Outdoors, the agents often dissipate rapidly.

**Biological:** Biological agents are organisms or toxins that can kill or incapacitate people, livestock, and crops. The three basic groups of biological agents that would likely be used as weapons are bacteria, viruses, and toxins. Most biological agents are difficult to grow and maintain. Many break down quickly when exposed to sunlight and other environmental factors, while others, such as anthrax spores, are very long lived. Biological agents can be dispersed by spraying them into the air, by infecting animals that carry the disease to humans and by contaminating food and water.

**Radiological:** Terrorist use of a radiological dispersion device – often called a “dirty nuke” or “dirty bomb” – is considered far more likely than use of a nuclear explosive device. A RDD combines a conventional explosive device – such as a bomb – with radioactive material. It is designed to scatter dangerous and sub-lethal amounts of radioactive material over a general area. Such RDDs appeal to terrorists because they require limited technical knowledge to build

and deploy compared to a nuclear device. Also, the radioactive materials in RDDs are widely used in medicine, agriculture, industry, and research, and are easier to obtain than weapons grade uranium or plutonium.

**Nuclear:** A nuclear blast is an explosion with intense light and heat, a damaging pressure wave, and widespread radioactive material that can contaminate the air, water, and ground surfaces for miles around. A nuclear device can range from a weapon carried by a missile launched by a hostile nation or terrorist organization, to a small portable nuclear device transported by an individual. All nuclear devices cause deadly effects when exploded, including blinding light, intense heat (thermal radiation), initial nuclear radiation, blast, and secondary fires caused by the destruction or a heat pulse.

**Explosives:** Explosive devices are common terrorist weapons. Terrorists do not have to look far to find out how to make explosive devices; the information is readily available in books and other information sources. The materials needed for an explosive device can be found in many places including variety, hardware, and auto supply stores. Explosive devices are highly portable using vehicles and humans as a means of transport. They are easily detonated from remote locations or by suicide bombers.

**Homeland Security Advisory System (HSA System):** The HSA System is meant to guide the adoption of protective measures when specific information to a particular sector or region is received. The HSA System combines information on threats with vulnerability assessments and provides communications to public safety officials and the public.

- **Homeland Security Threat Advisories (HSA Advisories):** HSA Advisories contain actionable information about incidents involving, or threats targeting, critical national networks, infrastructure, or assets. HSA Advisories could, for example, relay newly developed procedures that, when implemented, would significantly improve security. They could also suggest a needed change in readiness posture, protective actions, or response. Advisories are targeted to Federal, state, and local governments, as well as private sector organizations and international partners.
- **Homeland Security Information Bulletins (HIS Bulletins):** HIS Bulletins communicate information of interest to the nation's critical infrastructures that do not meet the timeliness, specificity, or significance thresholds of warning messages. Information may include statistical reports, periodic summaries, incident response or reporting guidelines, common vulnerabilities, and configuration standards or tools. It also may include preliminary requests for information. Bulletins are targeted to Federal, state, and local governments, as well as private organizations and international partners.
- **The National Terrorism Advisory System, or NTAS,** replaces the color-coded Homeland Security Advisory System (HSAS). This new system will more effectively communicate information about terrorist threats by providing timely, detailed information to the public, government agencies, first responders, airports and other transportation hubs, and the private sector. These alerts will include a clear statement that there is an *imminent threat* or *elevated threat*. Using available information, the alerts will provide a concise summary of the potential threat, information about actions being taken to ensure public safety, and recommended steps that individuals, communities, businesses and governments can take to help prevent, mitigate or respond to the threat.

Like the Los Angeles County Operational Area, the Cities have chosen to take a broad approach to terrorism planning, instead of developing specific plans for each potential terrorist target. Nationwide experience demonstrates that there are no longer targets or population groups that are “off limits” to terrorists.

## Impacts

Terrorism incidents might conceivably cause the following impacts:

- Significant injuries and deaths
- Potential for fires and explosions
- Disruption of transportation systems
- Interference with law enforcement activities
- Destruction of utilities and other public services
- Damage to public infrastructure and facilities
- Residential displacement, including evacuations
- Individuals trapped and injured in unsafe conditions
- Need for emergency food, shelter, and medical care
- Economic impacts, both short and long-term
- Need for highly specialized responders
- Health issues related to discharges or releases
- Water pollution and quality degradation

## Local Conditions

Throughout California and Los Angeles County there is a nearly limitless number of potential terrorist targets, including government facilities; schools; religious institutions; gathering places (shopping centers, entertainment venues, etc.); abortion clinics; power plants and other utility infrastructure; transportation infrastructure; oil refineries, water storage facilities; locations of high profile individuals; and, financial institutions. The Planning Area contains many of the aforementioned potential terrorist targets and is located nearby a multitude of others.

## Epidemic/Pandemic

### Hazard Identification

Vaccines, antibiotics, and improved living conditions resulted in dramatic declines in communicable diseases in the latter part of the 20th Century. However, infectious diseases

have become an increasing threat to all persons in Los Angeles County due to a variety of factors such as: population growth (overcrowding, aging, migration), methods of food production (large scale, wide distribution, importation), environmental changes (drought, encroachment of humans on wild areas, global warming), microbial adaptation (resistance to antibiotics, re-assortment of genetic material), changes in health care (drugs causing immunosuppression, widespread use of antibiotics), and human behavior (travel, diet, sexual behavior, compromised immune systems).

Problems (infection or illness) would be identified by a variety of entities:

- ✓ Clinicians (urgent care, hospitals, clinics)
- ✓ Pharmacists
- ✓ Veterinarians
- ✓ Animal Control
- ✓ Vector Control
- ✓ Emergency medical personnel (first responders, EMT's, Paramedics, ER personnel)
- ✓ Laboratorians
- ✓ Pathologists
- ✓ Coroner

Current epidemic threats include:

- ✓ **West Nile Virus**
  - Mosquitoes spread this virus. A small proportion of persons infected develop systems, which can range from fever and body aches to encephalitis. West Nile Virus was first detected in the United States in New York City in 1999 and has moved westward in subsequent years, causing epidemics across the country.
- ✓ **Antibiotic-resistant microorganisms**
  - Widespread and improper use of antibiotics and insufficient use of control measures has resulted in resistance to antibiotics. Methicillin-resistant Staphylococcus aureus (MRSA) has become resistant to many other antibiotics and a new strain recently began circulating in the community.
- ✓ **Pandemic influenza**
  - 'Pandemic' refers to a worldwide epidemic. New influenza strains with pandemic potential can appear when animal and human strains have the opportunity to exchange genetic material resulting in a virulent strain that can infect humans. This could happen at any time.
- ✓ **Reemergence of Severe Acute Respiratory Syndrome (SARS)**
  - SARS likely emerged from an animal or animals in China to infect humans. Reemergence could occur at any time, since the actual source is unknown and cannot be eradicated.
- ✓ **Food borne illness**
  - Contaminated food sources and human error can cause food borne outbreaks. Small food borne outbreaks occur frequently.
- ✓ **Bioterrorism**
  - The diseases of greatest concern include anthrax, smallpox, plague, tularemia, botulism, and viral hemorrhagic fevers.

## Impact

- ✓ Injury and loss of life
- ✓ Commercial and residential structural damage
- ✓ Disruption of and damage to public infrastructure
- ✓ Secondary Health hazards e.g., mold and mildew
- ✓ Damage to roads/bridges resulting in loss of mobility
- ✓ Significant economic impact (jobs, sales, tax revenue) upon the community
- ✓ Negative impact on commercial and residential property values
- ✓ Significant disruption to students and teachers as temporary facilities and relocations are needed

### *Local Conditions*

Because of the nature of epidemic and pandemic hazards it is difficult to identify specific locations or populations clusters that would be vulnerable to a particular hazardous event. As such, no specific infrastructure, government structure, population centers have been identified as being targets or at any greater risk than any other location.

## Energy Shortage

### *Hazard Identification*

Loss of electrical services would mean a potential life-threatening situation in the case of electricity for medically dependent residents, and a public health threat if the services are disrupted for some time due to accidental or terrorist acts.

An energy shortage is any interruption or loss of electrical service due to disruption of power generation or transmission caused by an accident, sabotage, natural hazards, equipment failure, or fuel shortage. These interruptions can last anywhere from a few seconds to several days. Energy Shortages are considered significant only if the local Emergency Management Organization is required to coordinate basic services such as the provision of food, water, and heating as a result. Energy Shortages are common with severe weather and winter storm activity.

The massive 2011 Southern California electricity outage brought to light many critical issues surrounding the state's power generation and distribution system, including its dependency on out-of-state resources. Although California has implemented effective energy conservation programs, the state continues to experience both population growth and weather cycles that contribute to a heavy demand for power.

Hydro-generation provides approximately 25% of California's electric power, with the balance coming from fossil fuels, nuclear, and green sources. As experienced in 2000 and 2001, blackouts can occur due to losses in transmission or generation and/or extremely severe temperatures that lead to heavy electric power consumption.

## Impact

- ✓ Injury and loss of life
- ✓ Disruption of and damage to public infrastructure (particularly water distribution and sewer management)
- ✓ Secondary Health hazards e.g., mold and mildew
- ✓ Economic impacts (jobs, sales, tax revenue) upon the community
- ✓ Significant disruption to population centers
- ✓ Dangerous threats posed to health care facilities
- ✓ Disruption to delivery of emergency services

### *Local Conditions*

The effects of an energy shortage would affect all occupants of the Planning Area. Perhaps most at risk would be medically challenged individuals with health care equipment reliant on electricity (e.g. oxygen), businesses, emergency service locations, and vulnerable populations center (e.g. schools).

## Radiological Accidents

### *Hazard Identification*

There are two operating nuclear power plants (NPP) in California: the Diablo Canyon Power Plant in San Luis Obispo County, and the San Onofre Nuclear Generating Station (SONGS) in San Diego County. Two other nuclear power plants, Humboldt Bay and Rancho Seco, are not operational, but have spent fuel stored on-site.

The Planning Area is approximately 55 miles north of SONGS. There are three emergency zones established around SONGS to educate and, if necessary, evacuate the people who live and work near the plant. The zones are: the Emergency Planning Zone (10-mile radius), the Public Education Zone (20-mile radius), and the Ingestion Pathway Zone (50-mile radius). Given the distance of the Planning Area from SONGS, it does not fall within any of the SONGS emergency zones.

## Transportation Accidents

### *Hazard Identification*

#### **Ports**

The Port of Long Beach, also known as Long Beach's Harbor Department, is the second busiest container port in the USA after the Port of Los Angeles, which it adjoins. Acting as a major gateway for U.S.-Asian trade, the port occupies 3,200 acres of land with 25 miles of waterfront in the City of Long Beach.

#### **Airplane Accidents**

Airline accidents are listed as a "low" threat because the number of deaths and extent of property damage is considerably less than say, a large earthquake. Following is a summary of the airplane accidents that have happened since 1987 in the region.

Table 8-2: Historic Airplane Accidents in Southern California  
 (Source: <http://www.nts.gov/aviationquery/index.aspx>)

| Event Date | Probable Cause Released | Location        | Make / Model                  | Event Severity | Type of Air Carrier Operation and Carrier Name (Doing Business As) |
|------------|-------------------------|-----------------|-------------------------------|----------------|--|
| 12/7/1987  | 1/4/1989                | San Luis Obispo | British Aerospace BAE-146-200 | Fatal (43)     | SCHD Pacific Southwest Airlines                                    |
| 2/1/1991   | 8/5/1993                | Los Angeles     | Boeing 737-300                | Fatal (34)     | SCHD USAir   |
| 1/31/2000  | 5/29/2003               | Port Hueneme    | Douglas MD-83                 | Fatal(88)      | SCHD Alaska Airlines Inc.  |
| 2/16/2000  | 9/17/2003               | Rancho Cordova  | Douglas DC-8-71F              | Fatal (3)      | NSCH Part 121: Air Carrier Emery Worldwide Airlines Inc.           |

A major air crash that occurs in a heavily populated area can result in considerable loss of life and property. The impact of a disabled aircraft as it strikes the ground creates the likely potential for multiple explosions, resulting in intense fires. Regardless of where the crash occurs, the resulting explosions and fires have the potential to cause injuries, fatalities and the destruction of property at and adjacent to the impact point. The time of day when the crash occurs may also have a profound effect on the number of dead and injured.

### Local Conditions

The skies above the Planning Area are heavily occupied by aircraft originating and departing from a number of airports located in the region. The airports nearest the Planning Area which handle the greatest amount of air traffic are as follows:

- Los Angeles International Airport (LAX): as of 2012 was ranked as the 3rd busiest airport in the United States.
- Long Beach Municipal Airport (LGB): as of 2009 was ranked as the 26<sup>th</sup> busiest airport in the United States.
- Zamperini Field (TOA): is a City-owned (Torrance) public use airport.

## Water Shortage

### Hazard Identification

In light of the fact Planning Area residents and businesses rely on imported water, it's impossible to separate drought from water supply shortages. Drought is defined as a deficiency of precipitation over an extended period of time, usually a season or more. This deficiency results in a water shortage for some activity, group, or environmental sector. Drought should be considered relative to some long-term average condition of balance between precipitation and evapotranspiration (i.e., evaporation + transpiration) in a particular area, a condition often perceived as "normal". It is also related to the timing (e.g., principal season of occurrence,

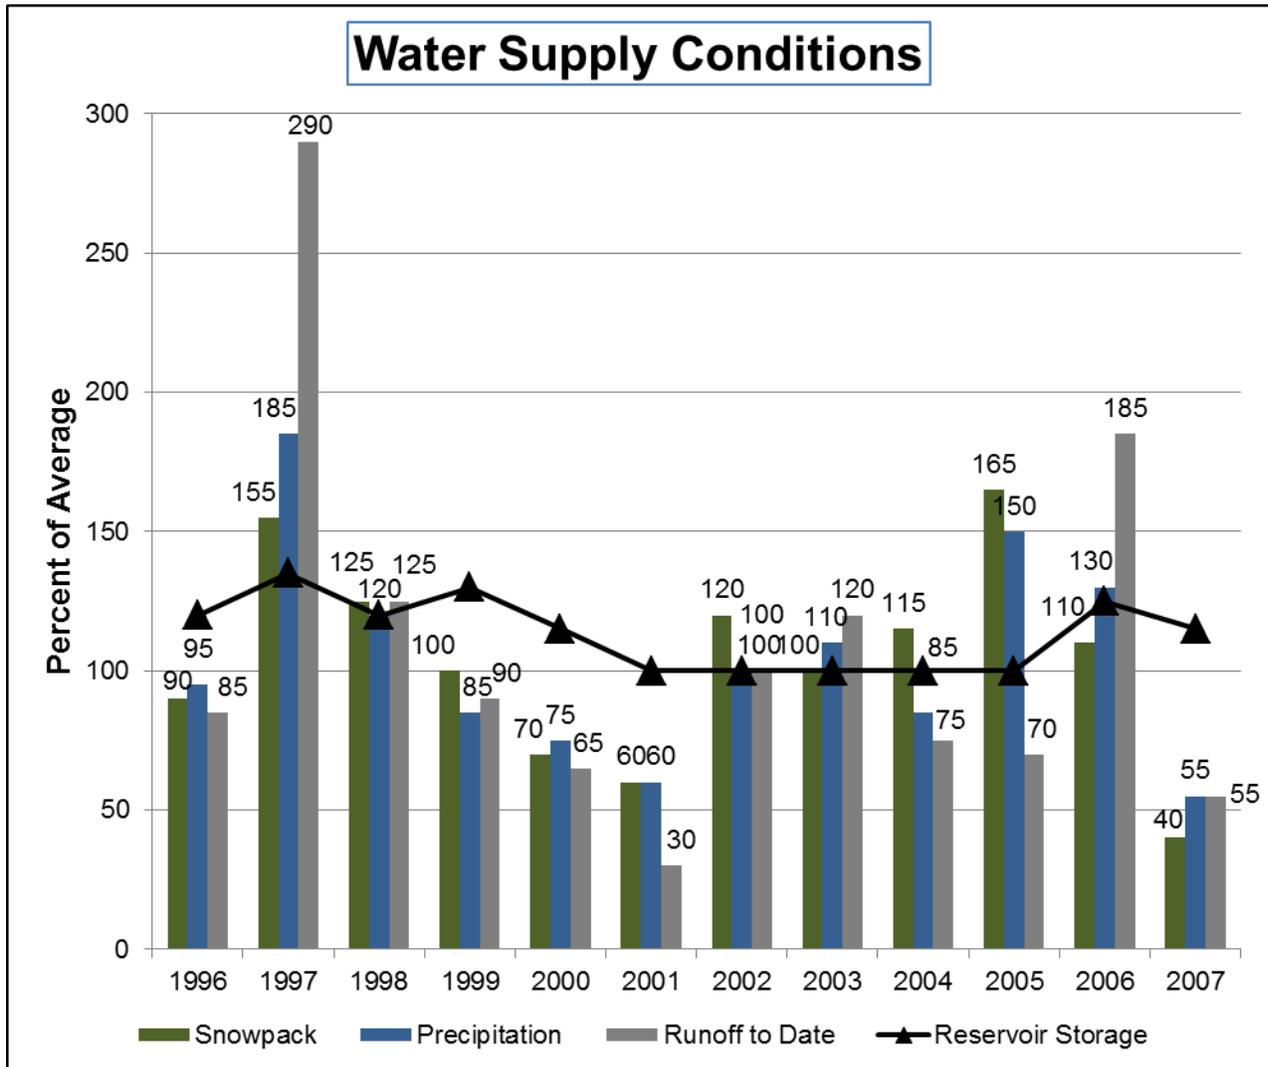

delays in the start of the rainy season, occurrence of rains in relation to principal crop growth stages) and the effectiveness of the rains (e.g., rainfall intensity, number of rainfall events).

Other climatic factors such as high temperature, high wind, and low relative humidity are often associated with it in many regions of the world and can significantly aggravate its severity. Drought should not be viewed as merely a physical phenomenon or natural event. Its impacts on society result from the interplay between a natural event (less precipitation than expected resulting from natural climatic variability) and the demand people place on water supply. Human beings often exacerbate the impact of drought. Recent droughts in both developing and developed countries and the resulting economic and environmental impacts and personal hardships have underscored the vulnerability of all societies to this natural hazard.

One dry year does not normally constitute a drought in California, but serves as a reminder of the need to plan for droughts. California's extensive system of water supply infrastructure — its reservoirs, groundwater basins, and inter-regional conveyance facilities — mitigates the effect of short-term dry periods for most water users. Defining when a drought begins is a function of drought impacts to water users. Hydrologic conditions constituting a drought for water users in one location may not constitute a drought for water users elsewhere, or for water users having a different water supply. Individual water suppliers may use criteria such as rainfall/runoff, amount of water in storage, or expected supply from a water wholesaler to define their water supply conditions.

Figure 8-1: Water Supply Conditions below illustrates several indicators commonly used to evaluate California water conditions. The percent of average values are determined for measurement sites and reservoirs in each of the State's ten major hydrologic regions. Snow pack is an important indicator of runoff from Sierra Nevada watersheds, the source of much of California's developed water supply.

Figure 8-1: Water Supply Conditions  
 (Source: California Department of Water Resources)

Drought is a gradual phenomenon. Although droughts are sometimes characterized as emergencies, they differ from typical emergency events. Most natural disasters, such as floods or forest fires, occur relatively rapidly and afford little time for preparing for disaster response. Droughts occur slowly, over a multiyear period. There is no universal definition of when a drought begins or ends. Impacts of drought are typically felt first by those most reliant on annual rainfall -- ranchers engaged in dry land grazing, rural residents relying on wells in low-yield rock formations, or small water systems lacking a reliable source. Criteria used to identify statewide drought conditions do not address these localized impacts. Drought impacts increase with the length of a drought, as carry-over supplies in reservoirs are depleted and water levels in groundwater basins decline.

There are four different ways that drought can be defined:

- 1) **Meteorological** - a measure of departure of precipitation from normal. Due to climatic differences what is considered a drought in one location may not be a drought in another location.
- 2) **Agricultural** - refers to a situation when the amount of moisture in the soil no longer meets the needs of a particular crop.
- 3) **Hydrological** - occurs when surface and subsurface water supplies are below normal.
- 4) **Socioeconomic** - refers to the situation that occurs when physical water shortage begins to affect people.

### Impact

- ✓ Health complications from limited or use of non-potable water
- ✓ Disruption of and damage to public infrastructure (contamination to water distribution systems, blockages in sewer system)
- ✓ Loss to governments, commercial, and residential properties of landscaping materials
- ✓ Economic impacts (jobs, sales, tax revenue) upon the community
- ✓ Added cost of bottled and other water sources
- ✓ Compromises to hygiene
- ✓ Dangerous threats posed to health care facilities
- ✓ Disruption to delivery of emergency services (e.g. firefighting)

### *Local Conditions*

The Planning Team identified concerns regarding water shortage due to the fact that the peninsula's water is pumped uphill through an array of complicated water lines and pumps. In the event of a catastrophic disaster, Cal Water predicts it would only have 1 to 2 days of water supply for the peninsula. Cal Water would be able to sustain a low flow as long as they could retain power.

## Natural Gas Pipeline Incidents

### *Hazard Identification*

Virtually all natural gas, which accounts for about 28 percent of energy consumed annually, is transported by transmission pipelines. Although California is a leader in exploring and implementing alternative energy sources such as wind and solar, the expansion of traditional energy sources, such as natural gas, continues.

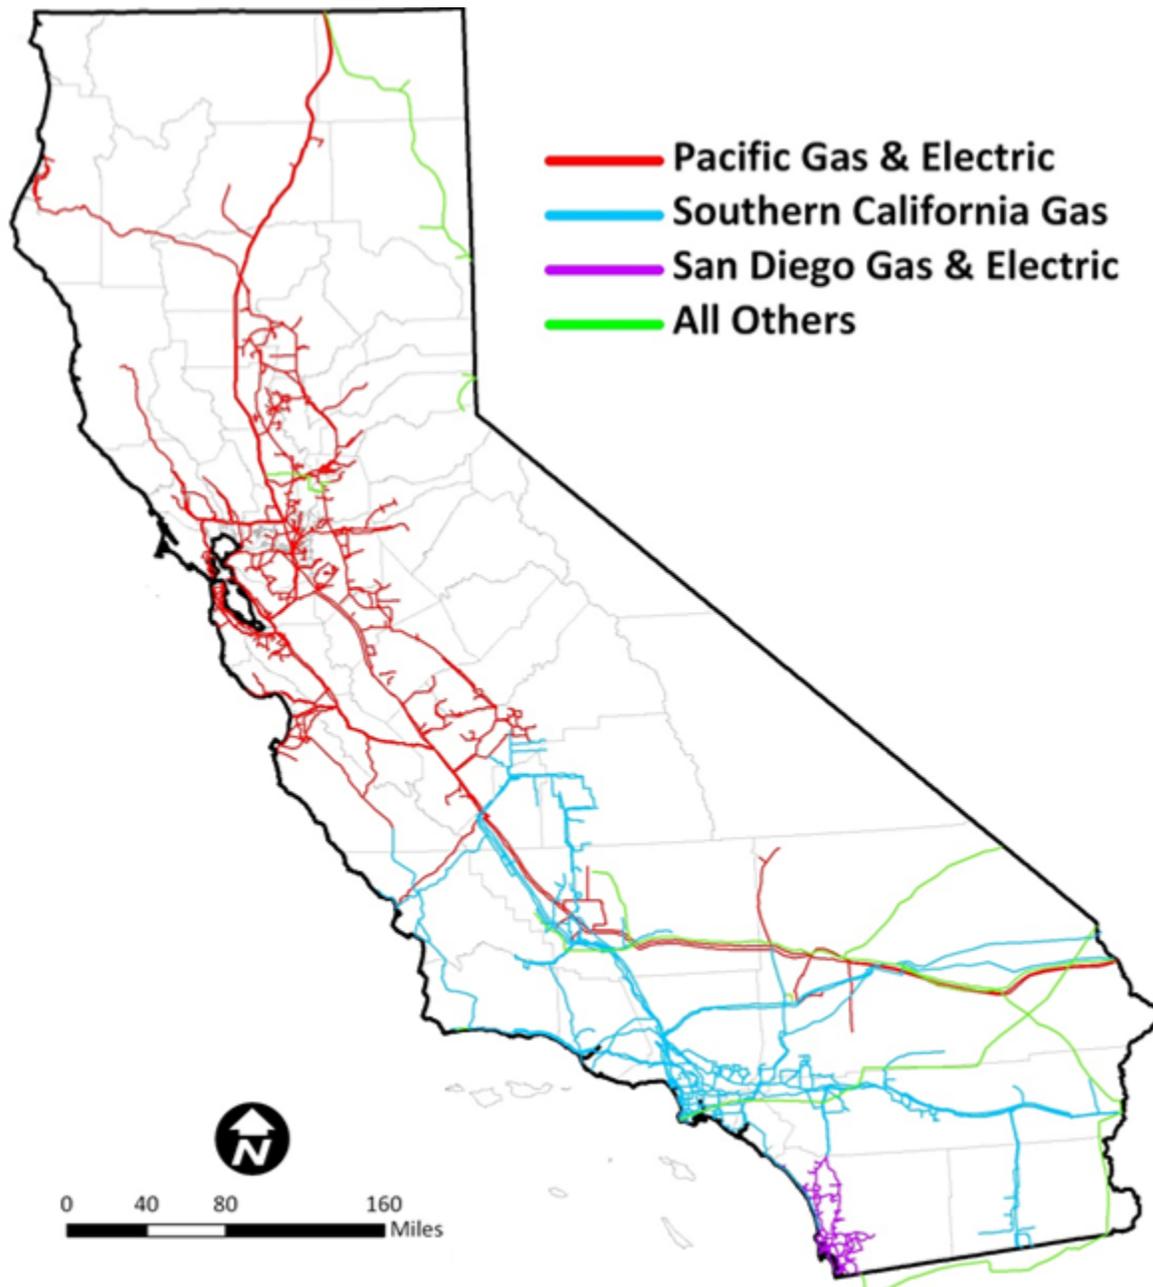

Compounding the potential risk is the age and gradual deteriorating of the gas transmission system due to natural causes. Significant failure, including pipe breaks and explosions, can result in loss of life, injury, property damage, and environmental impacts. Causes of and contributors to pipeline failures include construction errors, material defects, internal and external corrosion, operational errors, control system malfunctions, outside force damage, subsidence, and seismicity. Growth in population, urbanization, and land development near transmission pipelines, together with addition of new facilities to meet new demands, may increase the likelihood of pipeline damage due to human activity and the exposure of people and property to pipeline failures.

Map 8-1 shows the location and ownership of the natural gas pipeline system. Many of the pipelines are located in areas with high seismic activity, crossing the San Andreas and other active faults.

### Map 8-1 California Natural Gas Pipeline Systems

(Source: California Energy Commission, [http://www.energy.ca.gov/maps/Natural\\_Gas\\_Pipelines.pdf](http://www.energy.ca.gov/maps/Natural_Gas_Pipelines.pdf))

Generally speaking, transmission lines are large-diameter steel pipes carrying natural gas at high pressure and compressed to provide higher carrying capacity. Transmission lines are both interstate and intrastate, with the latter connecting to smaller distribution lines delivering gas directly to homes and businesses. Data compiled by the Pipeline and Hazardous Materials Safety Administration (PHMSA) report a total of 115,291 miles of gas pipelines in California, of which 12,414 are classified as gas transmission lines, 403 are gas-gathering lines, and the majority, 102,475, are for gas distribution. Nearly 40 percent of gas transmission lines are located in Los Angeles, Kern, and San Bernardino counties.

## San Bruno Gas Transmission Line Explosion

On September 9, 2010, a 30-inch steel natural gas transmission pipeline owned and operated by PG&E ruptured and exploded in the City of San Bruno residential neighborhood. The blast and ensuing inferno resulted in 8 confirmed deaths, 66 reported injuries, 34 destroyed structures, and 8 damaged structures. Cal OES has identified preliminary damage estimates at \$15.4 million, including \$2.5 million for debris removal, \$10.2 million for protective measures, \$2.1 million for roads and bridges, and \$0.6 million for utilities and other facilities. Investigations into the cause of the explosion are under way by the National Safety Transportation Board (NSTB), the California Public Utilities Commission (CPUC), and PG&E. Although it will not be confirmed until official investigations are completed, initial speculation points to the weakening of the 60-year-old pipeline due to corrosion. The day after the explosion, the CPUC asked PG&E to provide a list of its top 100 high-priority projects to upgrade or replace portions of the pipeline for reasons of public safety, as well as information on the status of listed projects. The list was published on September 21, 2010. Although targeted for repair several years ago, the San Bruno pipeline was not on the list.

### Impact

- ✓ Injury and loss of life
- ✓ Catastrophic damage to natural gas pipe
- ✓ Disruption of and damage to public infrastructure
- ✓ Damage to roads and bridges
- ✓ Secondary fires and explosions
- ✓ Economic impacts (jobs, sales, tax revenue) upon the community
- ✓ Significant demands on emergency services

### *Local Conditions*

There are natural gas transmission pipelines within the Planning Area, as well as adjoining communities.

## PART III: MITIGATION STRATEGIES

# Section 9: Mitigation Strategies

---

### Overview of Mitigation Strategy

As the cost of damage from disasters continues to increase nationwide, the Cities recognize the importance of identifying effective ways to reduce vulnerability to disasters. Hazard mitigation plans assist communities in reducing risk from hazards by identifying resources, information, and strategies for risk reduction, while helping to guide and coordinate mitigation activities throughout the Cities.

The Plan provides a set of action items to reduce risk from hazards such as education and outreach programs and the development of partnerships. The Plan also provides for the implementation of preventative activities, including programs that restrict and control development in areas subject to damage from natural hazards.

The resources and information within the Plan:

- ✓ Establish a basis for coordination and collaboration among agencies and the public in RPV/RHE
- ✓ Identify and prioritize future mitigation projects
- ✓ Assist in meeting the requirements of federal assistance programs

The Plan works in conjunction with other City plans, including Multi-Hazard Functional Plans.

### Planning Approach

The four-step planning approach outlined in the FEMA publication, *Developing the Mitigation Plan: Identifying Mitigation Actions and Implementing Strategies* (FEMA 386-3) was used to develop this plan:

- ✓ **Develop mitigation goals and objectives** - The risk assessment (hazard characteristics, inventory, and findings), along with municipal policy documents, were utilized to develop mitigation goals and objectives.
- ✓ **Identify and prioritize mitigation actions** - Based on the risk assessment, goals and objectives, existing literature/resources, and input from participating entities, mitigation activities were identified for each hazard. Activities were: 1) qualitatively evaluated against the goals and objectives, and other criteria; 2) identified as high, medium, or low priority; and 3) presented in a series of hazard-specific tables.
- ✓ **Prepare implementation strategy** - Generally, high priority activities are recommended for implementation first.  
However, based on community needs and goals, project costs, and available funding, some medium or low priority activities may be implemented before some high priority items.
- ✓ **Document mitigation planning process** - The mitigation planning process is documented throughout this plan.

## Mitigation Measure Categories

Following is FEMA’s list of mitigation categories. The activities identified by the Planning Team are consistent with the six broad categories of mitigation actions outlined in FEMA publication 386-3 *Developing the Mitigation Plan: Identifying Mitigation Actions and Implementing Strategies*.

- ✓ **Prevention:** Government administrative or regulatory actions or processes that influence the way land and buildings are developed and built. These actions also include public activities to reduce hazard losses. Examples include planning and zoning, building codes, capital improvement programs, open space preservation, and storm water management regulations.
- ✓ **Property Protection:** Actions that involve modification of existing buildings or structures to protect them from a hazard, or removal from the hazard area. Examples include acquisition, elevation, relocation, structural retrofits, storm shutters, and shatter-resistant glass.
- ✓ **Public Education and Awareness:** Actions to inform and educate citizens, property owners, and elected officials about hazards and potential ways to mitigate them. Such actions include outreach projects, real estate disclosure, hazard information centers, and school-age and adult education programs.
- ✓ **Natural Resource Protection:** Actions that, in addition to minimizing hazard losses preserve or restore the functions of natural systems. Examples include sediment and erosion control, stream corridor restoration, watershed management, forest and vegetation management, and wetland restoration and preservation.
- ✓ **Emergency Services:** Actions that protect people and property during and immediately following a disaster or hazard event. Services include warning systems, emergency response services, and protection of critical facilities.
- ✓ **Structural Projects:** Actions that involve the construction of structures to reduce the impact of a hazard. Such structures include dams, levees, floodwalls, retaining walls, and safe rooms.

## Goals\*

The Planning Team developed mitigation goals to avoid or reduce long-term vulnerabilities to natural hazards. These general principles clarify desired outcomes.

The goals are based on the risk assessment and Planning Team input, and represents a long-term vision for hazard reduction or enhanced mitigation capabilities. They are compatible with community needs and goals expressed in other planning documents prepared by the Cities.

Each goal is supported by mitigation action items. The Planning Team developed these action items through its knowledge of the local area, risk assessment, review of past efforts, identification of mitigation activities, and qualitative analysis.

|   |
|---|
| <p><b>* ELEMENT C. MITIGATION STRATEGY   C3</b></p> <p>C3. Does the Plan include goals to reduce/avoid long-term vulnerabilities to the identified hazards? (Requirement §201.6(c)(3)(i))</p> |
|---|

The five mitigation goals and descriptions are listed below.

### Protect Life and Property

Implement activities that assist in protecting lives by making homes, businesses, infrastructure, critical facilities, and other property more resistant to losses from hazards.

Improve hazard assessment information to make recommendations for avoiding new development in high hazard areas and encouraging preventative measures for existing development in areas vulnerable to hazards.

### Enhance Public Awareness

---

FEMA defines **Goals** as general guidelines that explain what you want to achieve. They are usually broad policy-type statements, long-term, and represent global visions.

FEMA defines **Mitigation Activities** as specific actions that help you achieve your goals and objectives.

---

Develop and implement education and outreach programs to increase public awareness of the risks associated with hazards.

Provide information on tools; partnership opportunities, and funding resources to assist in implementing mitigation activities.

### Preserve Natural Systems

Support management and land use planning practices with hazard mitigation to protect life.

Preserve, rehabilitate, and enhance natural systems to serve hazard mitigation functions.

### Encourage Partnerships and Implementation

Strengthen communication and coordinate participation with public agencies, citizens, non-profit organizations, business, and industry to support implementation.

Encourage leadership within the Cities and public organizations to prioritize and implement local and regional hazard mitigation activities.

### Strengthen Emergency Services

Establish policy to ensure mitigation projects for critical facilities, services, and infrastructure.

Strengthen emergency operations by increasing collaboration and coordination among public agencies, non-profit organizations, business, and industry.

Coordinate and integrate hazard mitigation activities where appropriate, with emergency operations plans and procedures.

The Planning Team also developed hazard-specific mitigation goals, which appear in Section 9: Mitigation Strategies.

## Public Participation\*

Public input during development of the Plan assisted in creating plan goals. Meetings and follow-on discussions with the Planning Team members yielded historical information on hazard events, status updates on the identified mitigation action items, action item priorities, and new action items.

In addition to the Planning Team, other public input was solicited through both City websites.

## How are the Mitigation Action Items Organized?

The Planning Team chose to separate the Mitigation Action Item Matrices because the process of implementing a shared matrix is impractical.

The action items are a listing of activities in which City agencies and citizens can be engaged to reduce risk. Each action item includes an estimate of the timeline for implementation.

The action items are organized within the following Mitigation Actions Matrix, which lists all of the multi-hazard (actions that reduce risks for more than one specific hazard) and hazard-specific action items included in the Plan. Data collection and research and the public participation process resulted in the development of these action items (Section 10: Planning Process). Each Matrix includes the following information for each action item:

### *Funding Source*

The action items can be funded through a variety of sources, possibly including: operating budget/general fund, development fees, Community Development Block Grant (CDBG), Hazard Mitigation Grant Program (HMGP), other Grants, private funding, Capital Improvement Plan, and other funding opportunities.

### *Coordinating Organization*

The Mitigation Actions Matrix (Table 9-2) assigns primary responsibility for each of the action items. The hierarchies of the assignments vary – some are positions, others departments, and other committees. The primary responsibility for implementing the action items falls to the entity shown as the “Coordinating Organization”. The coordinating organization is the agency with regulatory responsibility to address hazards, or that is willing and able to organize resources, find appropriate funding, or oversee activity implementation, monitoring, and evaluation. Coordinating organizations may include local, county, or regional agencies that are capable of or responsible for implementing activities and programs.

**\* ELEMENT A: PLANNING PROCESS | A3**  
A3. Does the Plan document how the public was involved in the planning process during the drafting stage? (Requirement §201.6(b)(1))

### *Plan Goals Addressed*

The plan goals addressed by each action item are included as a way to monitor and evaluate how well the Plan is achieving its goals once implementation begins.

The plan goals are organized into the following five areas:

- ✓ Protect Life and Property
- ✓ Enhance Public Awareness
- ✓ Preserve Natural Systems
- ✓ Encourage Partnerships and Implementation
- ✓ Strengthen Emergency Services

### *Comments*

Planning Team department representatives provided status updates on each of the mitigation action items identified in the 2004 Plan. The status was indicated in the comments column using the following categories: New, Revised, Completed, Deleted, and Deferred.

### *Funding Source and Planning Mechanism\**

Both cities have a wide range of possible funding sources for their identified projects. The General Fund and Capital Improvement Plan provide support to a majority of the action items. Items also may be supported by private and public grants, Pre- and Post-Hazard Mitigation Grants, Community Development Block Grants, and other funding mechanisms. In addition to identifying the potential funding sources, the Planning Team identified “planning mechanism” that will be used to facilitate implementation. Planning mechanisms are regulatory resources. A complete list of planning mechanisms can be found in the Planning Process - Table 1-3: Existing Processes and Programs.

**\* ELEMENT C. MITIGATION STRATEGY | C6**

C6. Does the Plan describe a process by which local governments will integrate the requirements of the mitigation plan into other planning mechanisms, such as comprehensive or capital improvement plans, when appropriate? (Requirement §201.6(c)(4)(ii))

### *Ranking Priorities\**

To assist with implementing the Plan, the Planning Team adopted the following process for ranking mitigation action items. Designations of “High,” “Medium,” and “Low” priority have been assigned to each action item using the following criteria:

#### **Does the Action:**

- solve the problem?
- address Vulnerability Assessment?
- reduce the exposure or vulnerability to the highest priority hazard?
- address multiple hazards?
- benefits equal or exceed costs?
- implement a goal, policy, or project identified in the General Plan or Capital Improvement Plan?

#### **Can the Action:**

- be implemented with existing funds?
- be implemented by existing state or federal grant programs?
- be completed within the 5-year life cycle of the LHMP?
- be implemented with currently available technologies?

#### **Will the Action:**

- be accepted by the community?
- be supported by community leaders?
- adversely impact segments of the population or neighborhoods?
- require a change in local ordinances or zoning laws?
- positive or neutral impact on the environment?
- comply with all local, state and federal environmental laws and regulations?

#### **Is there:**

- sufficient staffing to undertake the project?
- existing authority to undertake the project?

During the prioritization meeting of the Planning Team, department representatives were provided worksheets for each of their assigned action items. Answers to the criteria above determined the priority according to the following scale.

- 1-6 = Low priority
- 7-12 = Medium priority
- 13-18 = High priority

#### **\* ELEMENT C. MITIGATION STRATEGY | C5**

C5. Does the Plan contain an action plan that describes how the actions identified will be prioritized (including cost benefit review), implemented, and administered by each jurisdiction? (Requirement §201.6(c)(3)(iv)); (Requirement §201.6(c)(3)(iii))

## The General Plans

The Planning Team went to great lengths to examine the various regulatory documents influencing the community's ability to mitigate against the identified hazards. Perhaps, the most important of these documents was the General Plan for both cities. It is the intention of the Planning Team to link the Plan actions items as closely as possible to the General Plans. The purpose of this association is that many development projects require a determination of "General Plan conformity" prior to approval. If the Plan and General Plans are aligned, this will better ensure both the sustainability and implementation of the Plan. Since the establishment of the DMA 2000 regulations, FEMA and other regulators have been frustrated by the ineffectiveness of Plan implementation – in other words, the failure of plans to actually affect the built environment and cause a reduction in risk. The Planning Team believes that changing the circle of build-damage-rebuild can most effectively be broken by linking the Plan to the regulations and policy guidelines that allow for construction and land use.

Following are lists of mitigation-related policies drawn from each of the Cities' General Plans.

### *City of Rancho Palos Verdes: General Plan Policies*

#### **Safety Element:**

- 1: Promote education and safety awareness pertaining to all hazards which affect RPV residents and adjacent communities.
- 2: Adopt and enforce building codes, ordinances, and regulations using best practices which contain design and construction standards based upon appropriate levels of risk and hazard.
- 3: Encourage cooperation among adjacent communities to ensure law enforcement and fire protection mutual aid in emergency situations.
- 4: Cooperate with the fire protection agency and water company to ensure adequate water flow capabilities with adequate back-up throughout all areas of the City.
- 5: Continue to cooperate with fire protection agencies in utilizing public facilities for water and refueling location.
- 6: Develop and implement site design and maintenance criteria for areas of high fire hazard potential in coordination with fire protection agencies.
- 7: Implement reasonable and consistent house numbering and street naming systems.
- 8: Coordinate with the Fire Department to provide adequate emergency access to all streets, including the end points of cul-de-sacs, and along the sides of structures.
- 9: Ensure that services are available to adequately address health and sanitation issues.
- 10: Work with other jurisdictions to ensure that local, County, State, and Federal health, safety, and sanitation laws are enforced.
- 11: Develop and maintain relationships with the various levels of health, safety and sanitation agencies.
- 12: Ensure the availability of paramedic rescue and fire suppression services to all areas of the City.
- 13: Maintain and implement a current Standard Emergency Management Systems (SEMS) Plan to cope with major disasters.

## *City of Rolling Hills Estates: General Plan Policies*

### **Safety Element:**

**Goal 1:** The City will work with the County to ensure that critical structures remain safe and functional in the event of a disaster.

Policy 1.1 Ensure that existing critical and semi-critical structures throughout the City meet seismic safety standards within ten years and that new facilities are developed to upgraded standards.

Policy 1.2 Designate and develop specific critical facilities as emergency centers to serve the entire City and work with other Cities to maintain existing trauma care facilities that serve the region.

Policy 1.3 Work with the County to ensure that all fire equipment remains operable and adequate to respond to a major disaster.

Policy 1.4 Cooperate with the Los Angeles County Sheriff's Department to ensure that law enforcement services are ready and available to serve the City in the event of a major disaster.

Policy 1.5 Support earthquake strengthening and provision of alternative or backup services, such as water, sewer, electricity, and natural gas pipelines and connections, especially in areas of high seismic or geologic high hazard or where weak segments are identified by existing or future studies.

Policy 1.6 Enforce seismic design provisions for Seismic Zone 4 of the Uniform Building Code to ensure adequate review and inspection to ensure that stairways and elevators are adequately strengthened and nonstructural components such as emergency generators, water heaters, computers, and cabinets are securely anchored in critical facilities.

Policy 1.7 Require fault investigations along traces of the Palos Verdes and Cabrillo faults to comply with guidelines implemented by the Alquist-Priolo Special Studies Zone Act. Buildings for human occupancy should be setback a minimum of 50 feet from those faults that are shown to be active or from fault traces where the risk cannot be determined.

Policy 1.8 Require review by a structural engineer when a critical building or facility undergoes substantial improvements.

Policy 1.9 Require site specific geotechnical analysis in areas of potential liquefaction, especially in and adjacent to the Chandler landfill.

**Goal 2:** Require that the City's Planning and Engineering Departments to review projects future development in the City.

Policy 2.1 Discourage development which is adjacent to earthquake faults and other geological hazards.

Policy 2.2 Prohibit residential development on non-engineered fill of any kind.

Policy 2.3 Develop stringent site design and maintenance standards for areas with high fire hazard or soil erosion potential.

Policy 2.4 Regularly review the technical data on public safety and seismic safety for use in the decision-making process.

Policy 2.5 Continue to require preliminary investigations of tract sites by State-registered geotechnical engineers and certified engineering geologists (Chapter 70 County

Building Code) and ensure regular inspection of grading operations. Code and Safety regulations.

Policy 2.6 Encourage residents to plant groundcover to reduce the brush fire hazard in areas adjacent to canyons, and to maintain native drought tolerant slope cover and provide appropriate irrigation to maintain plant cover and prevent erosion.

Policy 2.7 Maintain storm drains to prevent local flooding and debris flows, and encourage residents to assist in maintaining those drains that are the responsibility of the homeowner.

Policy 2.8 The City will continue to enforce the Water Conservation Ordinance adopted in 1991.

Policy 2.9 Avoid construction in canyon bottoms and participate in the National Flood Insurance Program. Require new development or expansion of existing development adjacent to canyons to assess potential environmental impacts from increased run-off and erosion and evaluate appropriate mitigation.

Policy 2.10 Continue to enforce a Class B Roofing Ordinance for new development but encourage residents with wood shingle/unrated roofing materials to retrofit or upgrade their roofs with resistant eaves and awnings.

Policy 2.11 Support the development of secondary water supplies for emergency water flow needs in an emergency.

**Goal 3:** Plan and provide for the occurrence of disasters and emergencies.

Policy 3.1 Develop and coordinate medical assistance procedures in the event of a major disaster.

Policy 3.2 Inventory and, where necessary, acquire supplemental disaster communication equipment and other equipment, tools, and supplies.

Policy 3.3 Ensure that adequate provisions are made to supply drinking water for extended periods of time in the event of a major disaster.

Policy 3.4 Develop procedures to follow in the event of flooding, erosion, and possible reservoir failure and investigate ways of reducing the likelihood of their occurrence.

Policy 3.5 Ensure that the City Hall maintains a current emergency supply of water, food, blankets, and first aid to provide for all employees for a 3 day period.

Policy 3.6 Encourage private businesses to develop disaster preparedness plans for their employees.

Policy 3.7 Support the development and further implementation of a peninsula-wide disaster plan.

Policy 3.8 Increase public awareness of City emergency response plans, evacuation routes and shelters, and in ways to reduce risks at the home and office.

Policy 3.9 Establish and maintain a Multi-hazard Functional Plan, mutual aid agreements with neighboring jurisdictions, and coordinate with the American Red Cross and Los Angeles County Fire, Sheriff, and Public Social Services to develop specific plans for responding to emergencies.

Policy 3.10 Coordinate emergency planning efforts with building managers of high-occupancy facilities, dependent care centers (nursing homes, day care centers, etc.) and critical facilities located in the City to facilitate emergency response.

**Goal 4:** Assign key individuals In both the public and private sectors the responsibility of implementing public safety programs.

Policy 4.1 Provide City officials with a basis for disaster preparedness decision making and establish a public education program for disaster preparedness.

Policy 4.2 Establish a line of command to ensure that the decision making process will function satisfactorily in the event of a major disaster.

Policy 4.3 Coordinate with the citizen groups and organizations to establish a viable body to provide emergency assistance in the event of a natural disaster.

Policy 4.4 Encourage cooperation among adjacent communities to provide back-up law enforcement assistance in emergency situations.

**Goal 5:** Reduce local crime, to the greatest extent possible.

Policy 5.1 Work with, and support the Sheriff's Department in crime prevention and law enforcement efforts, to make sure there are adequate resources to meet the needs of the community.

Policy 5.2 Cooperate with neighboring cities, Los Angeles County, California State and U.S.

Policy 5.3 Evaluate the incidence of crime and develop measures needed to deter crime or apprehend the criminals.

**Goal 6:** Reduce the potential for hazardous waste contamination in the City.

Policy 6.1 Restrict the travel of vehicles carrying hazardous material through the City.

Policy 6.2 Monitor and limit the use and production of hazardous materials by businesses and industries in the City.

Policy 6.3 Ensure that no hazardous materials are dumped in Chandler Quarry landfill or in any other areas of the City.

Policy 6.4 Ensure that the Los Angeles County Sanitation District implements its closure and reclamation plans for Palos Verdes Landfill.

Policy 6.5 Support County Hazardous Materials Management Plan (adopted by C.C. Ordinance 516) objectives and enforcement of current Fire Code regulations regarding the storage of hazardous materials.

Policy 6.6 Work to promote the safe use and disposal of household hazardous wastes.

## Mitigation Actions Matrix\*†‡§

Following are Table 9-1 and 9-2: Mitigation Actions Matrix which identifies the existing and future mitigation activities developed by the Planning Team.

|   |
|---|
| <p><b>* ELEMENT C: HAZARD IDENTIFICATION AND RISK ASSESSMENT   C1</b></p> <p>C1. Does the plan document each jurisdiction’s existing authorities, policies, programs and resources and its ability to expand on and improve these existing policies and programs? (Requirement §201.6(c)(3))</p>  |
| <p><b>† ELEMENT C. MITIGATION STRATEGY   C4</b></p> <p>C4. Does the Plan identify and analyze a comprehensive range of specific mitigation actions and projects for each jurisdiction being considered to reduce the effects of hazards, with emphasis on new and existing buildings and infrastructure? (Requirement §201.6(c)(3)(ii))</p> |
| <p><b>‡ ELEMENT D. MITIGATION STRATEGY   D2</b></p> <p>D2. Was the plan revised to reflect progress in local mitigation efforts? (Requirement §201.6(d)(3))</p>   |
| <p><b>§ ELEMENT D. MITIGATION STRATEGY   D3</b></p> <p>D3. Was the plan revised to reflect changes in priorities? (Requirement §201.6(d)(3))</p>  |

**Table 9-1: Mitigation Actions Matrix: City of Rancho Palos Verdes**

| Action Item  | Accomplishments (✓) and Ideas for Future Implementation (○)   | Coordinating Organization                     | Timeline | Plan Goals Addressed      |                  |                 |                                 |                    | Funding Source and Planning Mechanisms (GF=General Fund, GR=Grant, CIP, GP=General Plan) | Ranking (L=Low, M=Med, H=High, n/a=not applicable) | 2014 Comments (Status – Completed, Revised, Deleted, New, and Deferred) |

# Section 10: Planning Process

## Plan Methodology

DMA 2000 emphasizes the importance of participatory planning in the development of Mitigation Plans. This Plan was written using the best available information from a wide variety of sources.

Throughout the planning process, the Cities made a concerted effort to gather information from City and County departments, as well as state and federal agencies, the local business community, planning area residents, and other stakeholders.

Disaster Mitigation Act of 2000

Requirement §201.6(c) (1)

[The plan shall include...]

the planning process used to develop the plan, including how it was prepared, who was involved in the process, and how the public was involved.

The Planning Team solicited information from internal and external departments and agencies with specific knowledge of hazards and past historical events, as well as planning and zoning codes, ordinances, and recent planning decisions. The hazard mitigation strategies contained in this plan were developed through an extensive planning process involving local businesses and residents.

In advance of presentation to the City Councils, the Planning Team submitted the Draft Plan to Cal OES and FEMA for review and conditional approval. FEMA conditional approval was granted on June 13, 2013, pending minor revisions and adoption by both City Councils.

Prior to presentation to the City Councils, the 2014 Plan was made available for review by external reviewers and the general public.

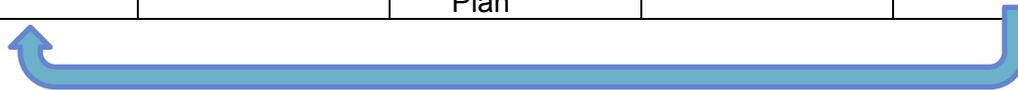

Input gathered from the review was incorporated into the Plan and included in the staff reports to the City Councils. On December 3, 2013, staff presented the Plan to the City of Rancho Palos Verdes City Council for discussion and adoption. On January 14, 2014, staff presented the Plan to the City of Rolling Hills Estates City Council for discussion and adoption. Copies of the City Council Resolutions adopting the Plan appear in Section 10: Planning Process. Following adoption by both City Councils, the Plan was re-submitted to FEMA. On [redacted] FEMA issued a final approval on the 2014 Plan.

The rest of this section describes the mitigation planning process including: 1) plan writing phases, 2) stakeholder involvement, 3) extended Planning Team support, 4) public and other stakeholder involvement; and 5) integration of existing data and plans.

## Planning Process Phases\*

Throughout the project, the Cities followed their traditional approaches to developing policy documents, including preparation of the First Draft Plan, then making the First Draft Plan available to the public and outside agencies. Sharing of the First Draft Plan was done in an effort to encourage questions, contributions, and comments from both the public and external agencies. The next step was the creation of a Second Draft Plan which incorporated any input gathered during the earlier review. The next step was to notice the upcoming public decision-maker meetings, distribution of the Third Draft Plan to the City Councils which included a briefing on any comments gathered during the Second Draft Plan review, and conducting the City Council public meetings. The final step was submission of the Final Draft Plan to FEMA, which incorporated the discussions and decisions of the City Councils.

|---|---|---|---|--|
| <ul style="list-style-type: none"> <li>• Planning Team input – research, meetings, writing, review of First Draft Plan</li> <li>• Notice to public and outside agencies of the availability of the First Draft Plan</li> <li>• Incorporate input from public and outside agencies into Second Draft Plan</li> </ul> | <ul style="list-style-type: none"> <li>• Second Draft Plan available for review by Planning Team, public, and outside agencies</li> <li>• Incorporate input from Planning Team, public, and outside agencies into Third Draft Plan</li> <li>• Submit Third Draft Plan to Cal OES/FEMA for preliminary review</li> </ul> | <ul style="list-style-type: none"> <li>• Public notice of upcoming City Council public meetings</li> <li>• Distribute Third Draft Plan to the City Council in advance of the public meetings</li> <li>• Present Third Draft Plan to the City Councils</li> <li>• City Councils Adopt Plan</li> <li>• Incorporate input from the City Council public meetings into Final Draft Plan</li> </ul> | <ul style="list-style-type: none"> <li>• Submit Final Draft Plan to FEMA for approval</li> <li>• Receive FEMA approval</li> <li>• Incorporate FEMA's date of approval into the Final Plan.</li> </ul> | <ul style="list-style-type: none"> <li>• Conduct Planning Team meetings</li> <li>• Integrate mitigation action items into budget, CIP and other funding and strategic documents</li> </ul> |

### \* ELEMENT A: PLANNING PROCESS | A3

A3. Does the Plan document how the public was involved in the planning process during the drafting stage?  
(Requirement §201.6(b)(1))

## Stakeholder Involvement

The stakeholders in this project included the Planning Team which consisted of internal and external department representatives from both Cities and external agencies, as well as the public and invited external agencies. All contributed greatly to the planning process during Planning Team meetings and the review process. Collectively, the stakeholder contributions included identifying hazard events, provision of status updates to the Mitigation Actions Matrix, development of new mitigation action items, developing public input strategies, and participating in plan review. Also, the stakeholders on the Planning Team provided numerous City-specific documents including the Capital Improvement Plans, General Plans, and other data sources critical to the planning process.

## Planning Team

The Planning Team first met on January 12, 2012 to review the updated requirements associated with DMA 2000 and to develop a work plan for creating the 2014 Plan. Additional Planning Team meetings were held on February 9, 2012, March 8, 2012, March 29, and April 19, 2012. The early meetings focused on identifying hazards and vulnerabilities, while the later meetings were dedicated to capturing the status of 2004 mitigation actions and development of new action items. In addition to Planning Team meetings, each member of the Team was involved in multiple reviews of the Plan and assisted with data collection and other reference and historical materials.

## Who Participated in Developing the Plan?

The Plan is the result of a collaborative planning effort between Cities of RPV/RHE citizens, public agencies, non-profit organizations, the private sector, regional, and state and federal organizations. Public participation played a key role in development of goals and action items. The Planning Team guided the process of the planning phases identified above.

**\* ELEMENT A: PLANNING PROCESS | A1**

A1. Does the Plan document the planning process, including how it was prepared and who was involved in the process for each jurisdiction? (Requirement §201.6(c)(1))

## Planning Team Involvement

The Planning Team was responsible for the following tasks:

- ✓ Establish plan development goals
- ✓ Prepare timetable for plan completion
- ✓ Developing a strategy for public involvement
- ✓ Ensure plan meets DMA 2000 requirements, and federal and state guidelines
- ✓ Organize and oversee public involvement
- ✓ Solicit participation of government agencies, businesses, residents, and other stakeholders
- ✓ Gather information (such as existing data and reports)
- ✓ Develop, revise, adopt, and maintain plan
- ✓ Participate in Planning Team meetings and City County public meeting
- ✓ Reviewing multiple drafts of the Plan

The Planning Team, with support from other City staff and local organizations, identified and profiled hazards; determined hazard rankings; estimated potential exposure or losses; evaluated development trends and specific risks; and developed mitigation goals, objectives, and activities.

During its meetings the Planning Team gathered and shared information, assessed risks, identified critical facilities, developed mitigation strategies, and provided continuity throughout plan development to ensure the plan addresses jurisdiction-specific hazard vulnerabilities and mitigation strategies. Members communicated regularly by phone and email between group meetings.

Both Cities will create a Hazard Mitigation Planning Team Subcommittees following FEMA approval of the 2014 Plan. Both Subcommittees will meet semi-annually after the plan is adopted. Members of the Subcommittees will provide project direction and oversight, assist with plan evaluation, and convene supplementary meetings as-needed.

## Outside Agency Involvement\*

In addition to the outside agencies involved on the Planning Team – Los Angeles County Fire Department and Area G – other outside agencies were informed during the plan writing phase of the availability of the First Draft Plan and encouraged to provide input. Notice was provided again in advance of the decision-maker public meetings. Any comments received through the external review process were identified in the staff reports to the City Councils and were incorporated into the Final Draft Plan. The list of neighboring communities, local and regional agencies that will be invited to participate in the plan writing phase and to review the Plan are listed below:

### \* ELEMENT A: PLANNING PROCESS | A2

A2. Does the Plan document an opportunity for neighboring communities, local and regional agencies involved in hazard mitigation activities, agencies that have the authority to regulate development as well as other interests to be involved in the planning process? (Requirement §201.6(b)(2))

- City of Rolling Hills
- City of Palos Verdes Estates
- Palos Verdes Peninsula Unified School District
- Los Angeles County Sheriff
- Verizon California
- Southern CA Edison
- The Gas Company
- Cal Water
- Palos Verdes Peninsula Chamber of Commerce

## State and Federal Guidelines and Requirements for Mitigation Plans

Following are the Federal requirements for approval of a mitigation plan:

- ✓ Open public involvement, with public meetings that introduce the process and project requirements.
- ✓ The public must be afforded opportunities for involvement in identifying and assessing risk, drafting a plan, and public involvement in approval stages of the plan.
- ✓ Community cooperation with an opportunity for other local government agencies, the business community, educational institutions, and non-profits to participate in the process.
- ✓ Incorporation of local documentation including the local General Plan, the Zoning Ordinance, the Building Codes, and other pertinent documents.

The following components must be part of the planning process:

- ✓ Complete documentation of the planning process
- ✓ A detailed risk assessment on hazard exposures in the planning area
- ✓ A comprehensive mitigation strategy, which describes the goals and objectives, including proposed strategies, programs and actions to avoid long-term vulnerabilities
- ✓ A plan maintenance process, which describes the method and schedule of monitoring, evaluating and updating the plan and integration of the Plan into other planning mechanisms
- ✓ Formal adoption by the City Councils
- ✓ Plan review by Cal OES
- ✓ Plan approval by FEMA

These requirements are identified in greater detail in the following plan sections and supporting documentation.

Through its consultant, Emergency Planning Consultants, the Cities had access to numerous existing mitigation plans from around the country, as well as current FEMA Mitigation Planning standards (386 series) and the State of California Mitigation Plan Guidance.

Other reference materials consisted of state, county, and city mitigation plans, including:

To facilitate communication between the Planning Team and RPV/RHE residents, and to involve the public in ongoing planning and evaluation, this plan will be available to the public through a variety of venues.

- ✓ County of Los Angeles Mitigation Plan (2014)
  - ✓ State of California Multi-Hazard Mitigation Plan (2010)
- Hazard specific research: City staffs collected data and compiled research on five hazards: earthquakes, wildfires, earth movement, tsunamis, and technological/human-caused hazards.
- Research materials came from the Cities' General Plans, the Cities' Hazard Analysis contained in the Emergency Operations Plan, and state agencies including Cal OES and CAL FIRE. The City staffs conducted research by referencing long time City employees and locating information in historical documents. Information was also incorporated from after-action documentation provided for previous proclaimed and declared disasters. The City staffs also played a critical role in capturing previously unidentified mitigation activities, current and new mitigation activities, hazard resources, and ongoing programs.

## Public Participation\*

Upon completion of the First Draft Plan, the document was posted on the City websites. The public was encouraged to provide comments, submit questions, and to be actively engaged in the drafting of the plan. During the review period, prior to submission of the Plan to the City Councils, public participation opportunities were created through use of a two-week public comment period using hard copy and electronic media output transmitted through various city publicity outlets and conventional public noticing techniques utilized by both Cities. Copies of the notices of availability can be found at the end of the Planning Process Section.

To facilitate communication between the Planning Team and RPV/RHE residents, and to involve the public in ongoing planning and evaluation, the adopted Final Plan will be available to the public through a variety of venues, including posting on both City websites. The Planning Team recognizes that community involvement increases the likelihood that hazard mitigation will become a standard consideration in the planning area.

## Hazard Mitigation Programs

The Cities of RPV/RHE adhere to the Stafford Act, the California Emergency Services Act, and DMA 2000, which require local governments to develop and implement mitigation plans. Cities and counties have intimate knowledge of local geography, and they are on the front line with personnel and equipment during a disaster. Local governments are in the best position to assess their strengths, weaknesses, opportunities, and constraints.

### \* ELEMENT A: PLANNING PROCESS | A3

A3. Does the Plan document how the public was involved in the planning process during the drafting stage? (Requirement §201.6(b)(1))

## Coordination with Federal Policies\*

Floodplain ordinances provide guidance to both cities. The City of Rancho Palos Verdes adopted its ordinance in 2006. Rolling Hills Estates adopted its ordinance in 1974.

### **Attachment 10-1: City of Rancho Palos Verdes Floodplain Management Ordinance ORDINANCE NO. 441**

**AN ORDINANCE OF THE CITY OF RANCHO PALOS VERDES ADOPTING FLOODPLAIN REGULATIONS, AND ADDING CHAPTER 15.42 TO TITLE 15 OF THE RANCHO PALOS VERDES MUNICIPAL CODE.**

**THE CITY COUNCIL OF THE CITY OF RANCHO PALOS VERDES HEREBY ORDAINS AS FOLLOWS:**

#### Section 1. Findings.

(a) The City of Rancho Palos Verdes (the “City”) seeks to participate in the National Flood Insurance Program (NFIP) in order for owners of property in flood-prone areas within the City to qualify for federally subsidized flood insurance protection.

(b) As a condition of participation in the NFIP, the City is required to adopt and enforce a floodplain management ordinance that complies with NFIP regulations, in order to minimize the hazards of flooding.

(c) All legal prerequisites to the adoption of this Ordinance have occurred.

(d) The City Council hereby finds and determines that there is no possibility that adoption of this Ordinance may have a significant effect on the environment because the purpose of the ordinance is to prevent homes and other structures from being constructed in flood-prone areas. Therefore, pursuant to § 15061(b)(3) of Division 6 of Title 14 of the California Code of Regulations, the adoption of this Ordinance is exempt from the requirements of the California Environmental Quality Act (“CEQA”), as amended, and the CEQA Guidelines promulgated thereunder.

Section 2. Title 15 of the Rancho Palos Verdes Municipal Code is hereby amended by adding new Chapter 15.42 thereto to read as follows:

#### “CHAPTER 15.42

##### FLOODPLAIN MANAGEMENT

###### Sections:

15.42.010. Statutory Authorization.

15.42.020. Purpose.

15.42.030. Definitions.

15.42.040. Applicability.

15.42.050. Compliance.

15.42.060. Abrogation and Greater Restrictions.

15.42.070. Interpretation.

15.42.080. Approval of Development in Flood-Prone Areas.

15.42.090. Warning and Disclaimer of Liability.

15.42.100. Designation of the Floodplain Administrator.

15.42.110. Duties and Responsibilities of the Floodplain Administrator.

15.42.120. Standards of Construction.

#### **\* ELEMENT C. MITIGATION STRATEGY | C2**

C2. Does the Plan address each jurisdiction’s participation in the NFIP and continued compliance with NFIP requirements, as appropriate? (Requirement §201.6(c)(3)(ii))

15.42.130. Standards for Subdivisions or Other Proposed New Development.  
15.42.140. Standards For Utilities.

15.42.010. Statutory Authorization. In adopting Government Code Sections 65302, 65560, and 65800, the Legislature of the State of California conferred upon local governmental entities the authority to adopt regulations designed to promote the public health, safety, and general welfare of its citizenry. Therefore, the City Council of the City of Rancho Palos Verdes does hereby adopt the following floodplain management regulations.

15.42.020. Purpose. To establish land use regulation for properties situated in flood-prone areas so as to:

- (a) Minimize property damage due to flood conditions and safeguard public health, safety and general welfare;
- (b) Protect human life and health;
- (c) Minimize expenditure of public money for costly flood control projects;
- (d) Minimize the need for rescue and relief efforts associated with flooding, which generally are undertaken at the expense of the general public;
- (e) Minimize prolonged business interruptions;
- (f) Minimize damage to public facilities and utilities, such as water and gas mains, electric, telephone and sewer lines; and streets and bridges located in areas of special flood hazards;
- (g) Help maintain a stable tax base by providing for the sound use and development of areas of special flood hazard so as to minimize future blighted areas caused by flood damage;
- (h) Require that potential property buyers are notified that property is in an area of special flood hazard; and
- (i) Require that those who occupy the areas of special flood hazard assume responsibility for their actions.

15.42.030 Definitions. Unless specifically defined below, words or phrases used in this chapter shall be interpreted so as to give them the meaning they have in common usage and to give this chapter its most reasonable application.

- (a) Area of special flood hazard shall mean the land in the floodplain within the City subject to a one percent (1%) or greater chance of flooding in any given year.
- (b) Base flood shall mean a flood which has a one percent (1%) chance of being equaled or exceeded in any given year (also called a 100 year flood).
- (c) Development shall mean any manmade change to improved or unimproved real property, including but not limited to, buildings or other structures, mining, dredging, filling, grading, paving, excavation or drilling operations or storage of equipment or materials, as defined in Section 17.96.560 of this Code.
- (d) Flood or flooding shall mean a general and temporary condition of partial or complete inundation of normally dry land areas from: (1) the overflow of inland or tidal waters; (2) the unusual and rapid accumulation or runoff of surface waters from any source; (3) the collapse or subsidence of land along the shore of a body of water as a result of erosion or undermining caused by waves or currents of water exceeding anticipated cyclical levels or suddenly caused by an unusual and unforeseeable event that results in flooding, as defined in this definition.
- (e) Floodplain or flood-prone area shall mean any land area susceptible to being inundated by water from any source (see definition of flooding).
- (f) Floodplain Administrator shall mean the Director of Public Works.
- (g) Floodplain management shall mean the operation of an overall program of corrective and preventive measures

for reducing flood damage and preserving and enhancing, where possible, natural resources in the floodplain, including, but not limited to, emergency preparedness plans, flood control works, and floodplain management regulations.

(h) Floodplain management regulations shall mean zoning ordinances, subdivision regulations, building codes, health regulations, special purpose ordinances (such as a floodplain ordinance, grading ordinance and erosion control ordinance) and other applications of police power that control development in flood-prone areas. This term describes federal, state or local regulations in any combination thereof, which provide standards for preventing and reducing flood loss and damage.

(i) Governing body shall mean the City Council of the City of Rancho Palos Verdes.

(j) Historic structure shall mean any structure that is:

(1) Listed individually in the National Register of Historic Places (a listing maintained by the United States Department of Interior) or preliminarily determined by the Secretary of the Interior as meeting the requirements for individual listing on the National Register;

(2) Certified or preliminarily determined by the Secretary of the Interior as contributing to the historical significance of a registered historic district or a district preliminarily determined by the Secretary to qualify as a registered historic district;

(3) Individually listed on a state inventory of historic places in states with historic preservation programs which have been approved by the Secretary of Interior; or

(4) Individually listed on a local inventory of historic places in communities with historic preservation programs that have been certified either by an approved state program, as determined by the Secretary of the Interior, or directly by the Secretary of the Interior in states with approved programs.

(k) Manufactured home shall mean a structure, transportable in one or more sections, which is built on a permanent chassis and is designed for use with or without a permanent foundation when connected to the required utilities. Under this chapter, this term does not include a recreational vehicle.

(l) Manufactured home park or subdivision shall mean a parcel (or contiguous parcels) of land divided into two or more manufactured home lots for rent or sale.

(m) New construction shall mean structures for which the "start of construction" commenced on or after the effective date of this chapter, and includes any subsequent improvements to such structures.

(n) One hundred year flood shall have the same meaning as the term "base flood."

(o) Recreational vehicle shall mean any motor home, camper, house or tent trailer that may be used by persons for temporary occupancy (such as recreational, camping, travel or seasonal use), regardless of whether it has its own motor or is to be towed by a motorized vehicle. Recreational vehicle does not mean a manufactured home or mobile home.

(p) Start of construction includes substantial improvement and other proposed new development and shall mean the date the building permit was issued, provided the actual start of construction, repair, reconstruction, rehabilitation, addition, placement, or other improvement occurs within 180 days from the date of issuance of the permit. The actual start means either the first placement of permanent construction of a structure on a site, such as the pouring of slab or footings, the installation of piles, the construction of columns, or any work beyond the stage of excavation; or the placement of a manufactured home on a foundation. Permanent construction does not include land preparation, such as clearing, grading, and filling; nor does it include the installation of streets and/or walkways; nor does it include excavation for a basement, footings, piers, or foundations or the erection of temporary forms; nor does it include the installation on the property of accessory buildings, such as garages or sheds not occupied as dwelling units or not part of the main structure. For a substantial improvement to an existing structure, the actual start of construction means the first alteration of any wall, ceiling, floor, or other structural part of a building, whether

or not that alteration affects the external dimensions of the building.

(q) Structure shall mean anything that is built or placed on top of the ground, including a gas or liquid storage tank, as defined in Section 17.96.040 of this Code.

(r) Substantial damage shall mean damage of any origin sustained by a structure whereby the cost of restoring the structure to its pre-damaged condition would equal or exceed fifty percent (50%) of the market value of the structure before the damage occurred.

(s) Substantial improvement shall mean any repair, reconstruction, rehabilitation, addition, or other proposed new development of a structure, the cost of which equals or exceeds fifty percent (50%) of the market value of the structure before the "start of construction" of the improvement. This term includes structures which have incurred "substantial damage," regardless of the actual repair work performed. The term does not, however, include either:

(1) Any project for improvement of a structure to correct existing violations or state or local health, sanitary, or safety code specifications that have been identified by the local code enforcement official and which are the minimum necessary to assure safe living conditions; or

(2) Any alteration of an "historic structure," provided that the alteration will not preclude the structure's continued designation as an "historic structure."

15.42.040. Applicability. The provisions of this chapter shall apply to all areas identified as being within a floodplain or within a flood-prone area within the City of Rancho Palos Verdes.

15.42.050. Compliance. No structure or lot or parcel of land shall hereafter be constructed, located, extended, converted, or altered without full compliance with this chapter and other applicable regulations. A violation of any of the provisions of this chapter (including violations of conditions and safeguards established in connection with conditions) shall constitute a misdemeanor. Nothing herein shall prevent the City Council from taking such lawful action as is necessary to prevent or remedy any violation.

15.42.060. Abrogation and Greater Restrictions. This chapter is not intended to repeal, abrogate, or impair any existing easements, covenants, or deed restrictions. However, where this chapter and another ordinance, easement, covenant, or deed restriction conflict or overlap, whichever imposes the more stringent restrictions shall prevail.

15.42.070. Interpretation. In the interpretation and application of this chapter, all provisions shall be:

(a) Considered as minimum requirements;

(b) Liberally construed in favor of the governing body; and

(c) Deemed neither to limit nor repeal any other powers granted under state statutes.

15.42.080. Approval of Development in Flood-Prone Areas. The Floodplain Administrator or his or her designee shall review applications for proposed construction or other development in the City, including the placement of manufactured homes, pursuant to which he or she shall determine whether such construction or development is within flood-prone areas. If the Floodplain Administrator or his or her designee determines that such construction or development is proposed to be within flood-prone areas, he or she shall require such proposed construction or development to be constructed in compliance with this chapter.

15.42.090. Warning and Disclaimer of Liability. The degree of flood protection required by this chapter is considered reasonable for regulatory purposes and is based on scientific and engineering considerations. Flood heights may be increased by manmade or natural causes. Larger floods can and will occur on rare occasion. This chapter does not imply that land outside the Areas of Special Flood Hazards or uses permitted within such areas will be free from flooding or flood damages. This chapter shall not create liability on the part of the City, the City Council or by any officer or employee of the City of Rancho Palos Verdes, the State of California, or the Federal Insurance Administration, Federal Emergency Management Agency, for any flood damages that result from reliance on this

chapter or any administrative decision lawfully made hereunder.

15.42.100. Designation of the Floodplain Administrator. The Director of Public Works is hereby appointed to administer, implement, and enforce this chapter.

15.42.110. Duties and Responsibilities of the Floodplain Administrator. The duties and responsibilities of the Floodplain Administrator shall include, but not be limited to, the following:

(a) Permit Review. Review all development permit applications to determine that:

- (1) The requirements of this chapter have been satisfied;
- (2) All other required state and federal permits have been obtained; and
- (3) The site is reasonably safe from flooding.

(b) Establishment of Flood-Prone Areas. The Floodplain Administrator shall obtain, review, and reasonably utilize any base flood data available from any federal or state agency or other source to identify flood-prone areas within the City. This data will be on file at Rancho Palos Verdes City Hall in the Department of Public Works.

15.42.120. Standards of Construction. If a proposed building site is located in a flood-prone area, the following standards must be met:

(a) Anchoring. All new construction and substantial improvements, including manufactured homes, shall be designed or modified to be adequately anchored to prevent flotation, collapse or lateral movement of the structure resulting from hydrodynamic and hydrostatic loads, including the effects of buoyancy.

(b) Construction Materials and Methods.

(1) All new construction and substantial improvements, including manufactured homes, shall be constructed with materials and utility equipment resistant to flood damage;

(2) All new construction and substantial improvements, including manufactured homes, shall be constructed using methods and practices that minimize flood damage;

(3) All new construction and substantial improvements, including manufactured homes, shall be constructed with electrical, heating, ventilation, plumbing and air conditioning equipment and other service facilities that are designed and/or located so as to prevent water from entering or accumulating within the components during conditions of flooding.

15.42.130. Standards for Subdivisions or Other Proposed New Development. If a subdivision proposal or other proposed new development, including manufactured home parks or subdivisions, is in a flood-prone area, any such proposals shall be reviewed to assure that:

(a) All such proposals are consistent with the need to minimize flood damage within the flood-prone area;

(b) All such proposals have public utilities and facilities such as sewer, gas, electrical, and water systems located and constructed to minimize or eliminate flood damage; and

(c) All such proposals shall have adequate drainage provided to reduce exposure to flood hazards.

15.42.140. Standards For Utilities.

(a) All new and replacement water supply and sanitary sewage systems shall be designed to minimize or eliminate

infiltration of flood waters into the systems and discharge from the systems into flood waters.

(b) On-site waste disposal systems shall be located to avoid impairment to them, or contamination from them during flooding.”

Section 3. A new Section 16.04.070 is hereby added to Chapter 16.04 of Title 16 of the Rancho Palos Verdes Municipal Code to read as follows:

“16.04.070 Review for development within flood-prone areas. The Director of Planning, Building and Code Enforcement shall consult with the Floodplain Administrator (Director of Public Works) to determine whether an application proposes new construction or other development within a flood-prone area, as defined in Chapter 15.42 of Title 15 of the Rancho Palos Verdes Municipal Code.”

Section 4. A new Section 17.76.170 is hereby added to Chapter 17.76 of Title 17 of the Rancho Palos Verdes Municipal Code to read as follows:

“17.76.170 Review for development within flood-prone areas. The Director of Planning, Building and Code Enforcement shall consult with the Floodplain Administrator (Director of Public Works) to determine whether an application proposes new construction or other development within a flood-prone area, as defined in Chapter 15.42 of Title 15 of the Rancho Palos Verdes Municipal Code.”

Section 5. Severability. The City Council declares that, should any provision, section, paragraph, sentence or word of this Ordinance be rendered or declared invalid by any final court action in a court of competent jurisdiction, or by reason of any preemptive legislation, the remaining provisions, sections, paragraphs, sentences and words of this Ordinance shall remain in full force and effect.

Section 6. The City Clerk shall certify to the adoption of this Ordinance and shall cause the same to be published in the manner required by law.

PASSED AND ADOPTED this 15th day of August 2006.

/s/ Stefan Wolowicz  
Mayor

Attest:

/s/Carolynn Petru  
City Clerk

State of California )  
County of Los Angeles )ss  
City of Rancho Palos Verdes)

I, Carolynn Petru, City Clerk of the City of Rancho Palos Verdes, do hereby certify that the whole number of members of the City Council of said City is five; that the foregoing Ordinance No. 441 passed first reading on August 1, 2006, was duly and regularly adopted by the City Council of said City at a regular meeting thereof held on August 15, 2006, and that the same was passed and adopted by the following roll call vote:

AYES: Clark, Gardiner, Long, Stern, and Mayor Wolowicz  
NOES: None  
ABSENT: None  
ABSTAIN: None

## Attachment 10-2: City of Rolling Hills Estates Floodplain Management Ordinance

CITY OF ROLLING HILLS ESTATES  
LOS ANGELES COUNTY, CALIFORNIA  
ORDINANCE NO. 299

AN ORDINANCE OF THE CITY COUNCIL OF THE CITY OF ROLLING HILLS ESTATES AMENDING THE ROLLING HILLS ESTATES MUNICIPAL CODE IN RELATION TO CONSTRUCTION OF BUILDINGS IN AREAS SUBJECT TO FLOOD HAZARD

The City Council of the City of Rolling Hills Estates does hereby ordain as follows:

SECTION 1. The Rolling Hills Estates Municipal Code is hereby amended by the addition thereto of a new Section 1105 to read in full as follows:

"1105. FLOOD HAZARD. Subparagraph (a) of Section 308 of the Building Code is hereby amended to read as follows":

(a) Flood Hazard. Buildings are not permitted in an area determined by the Building Official to be subject to flood hazard by reason of inundation, overflow, or erosion. This prohibition shall not apply when provision is made to eliminate such hazard to the satisfaction of the Building Official by providing adequate drainage facilities, by protective walls, by suitable fill, by raising the floor level of the building, by a combination of these methods or by other means.

SECTION 2. The City Clerk shall certify to the passage of this Ordinance and shall cause the same to be published as required by law.

Passed and approved this 13 day of March, 1974.

ATTEST:

Anna M. Yalch  
City Clerk

J. E. Lehman  
MAYOR

STATE OF CALIFORNIA  
COUNTY OF LOS ANGELES  
CITY OF ROLLING HILLS ESTATES } SS.

I, ANNA M. YALCH, City Clerk of the City of Rolling Hills Estates, do hereby certify that the foregoing Ordinance No. 299 was regularly introduced and placed upon its first reading at a regular meeting of the City Council on the 27 day of February, 1974. That, thereafter, said

Ordinance was duly adopted and passed at a regular meeting of the City Council on the 13 day of March, 1974, by the following vote, to wit:

AYES: Anderson, Lehman, Mirels, Weber

NOES: None

ABSENT: Greenberg

I FURTHER CERTIFY that said Ordinance was thereupon signed by the Mayor of the City of Rolling Hills Estates.

  
CITY CLERK

In compliance with the National Flood Insurance Program, Rolling Hills Estates administers a flood management ordinance (Ordinance 299) whereby conditions are defined in order to develop in areas subject to flood hazard. In practice, however, canyon areas are the only natural flood hazard and they are generally designated as open space. Storm-induced flood problems in the City, as defined by the NFIP, would include flash floods in the canyon areas, saturated mudflows on the hillsides, and shallow flooding in streets and residences associated with poor storm drainage. Due to the small size of the canyon watersheds in the City, most flash floods in the canyons are short-lived. Exhibit 8-6 shows the location of the major flood prone canyons in the City.

**Localized Flooding.** The previous chapter noted the importance of adequate drainage on developed hillside lots. Channeling storm runoff away from the slopes and into storm drains prevent erosion and minimizes the chance of shallow mudflows on graded slopes. If improperly maintained, private storm drain systems can overflow and channel sheet flow or mud into a residence. Residential drainage infrastructure often ties into larger storm drain systems where they empty into natural drainage such as canyon areas. Paved concrete channels or flood velocity reduction structures are sometimes necessary in natural drainage to prevent erosion caused by the channeled runoff. Erosion is not only unsightly, but can undermine adjacent slopes and make them unstable.

**County Storm Drain System.** The Los Angeles County Department of Public Works maintains the largest system of storm drains in the City of Rolling Hills Estates. Storm drains are designed to convey ten year frequency storm flows, floods that are expected to be equaled or exceeded once every ten years. System performance is reviewed on a similar time scale. Storm drainage requirements are designed to prevent floods from rising above the curblines and beyond the right-of-way.

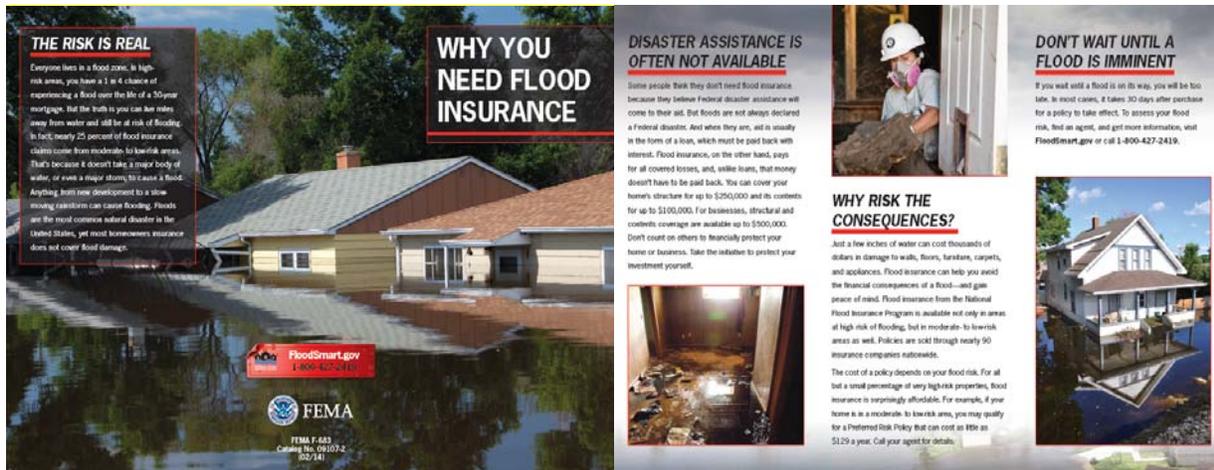

Exhibit 8-6 shows areas where the County Public Works has identified future storm drain needs in order to prevent: 1) flooding from rising outside the right-of-way and into private property or 2) environmental impacts caused by the over capacity of existing natural drainage. Curblines inundation is not a direct threat to public safety, however, if access to a fire hydrant is hindered by street inundation, fire fighting capability can be indirectly affected. Street circulation is also hampered by street inundation.

Sheet flow along local or private roads in the City is directed to storm drains or catchment basins. Minor flooding along such routes is tolerated until a flood or safety issue is posed. If system performance is substandard, either as indicated by County studies or citizen complaint, the City can contract with the County to correct the problem.

Both cities are involved in the NFIP, which helps the planning area receive funding for flood insurance and flood mitigation projects. Data from the NFIP was used in the risk assessment, resulting in a number of mitigation activities. According to the NFIP Community Status Report, both RPV/RHE are classified as Zone C Flood Areas, meaning there are no special flood hazard areas within either of the City limits. FEMA defines Zone C as a low-risk area above the 500-year flood level. This means that there is a 0.2% chance that an annual flood will occur.

Compliance with NFIP is ensured by both cities through their respective development services process (e.g. building permits, subdivision maps, etc.). As an example, when a prospective builder or an owner seeking a substantial improvement, the individual is directed to the development services counter when the property is analyzed for its proximity to the hazard-prone areas as indicated on the FIRM maps. This is a very important step in deciding whether an applicant can continue on in the development permitting process.

In addition to identifying the location of the project site on the FIRM map, each prospective developer is provided with a hard copy of the following brochure encouraging participation in NFIP.

## National Flood Insurance Program

Established in 1968, the NFIP provides federally-backed flood insurance to homeowners, renters, and businesses in communities that adopt and enforce floodplain management ordinances to reduce future flood damage. In both Cities, the Planning Director is designated as floodplain administrator.

## Current Mitigation Programs

The Cities intend to incorporate mitigation planning as an integral component of daily operations; the Hazard Mitigation Planning Subcommittee will work to integrate mitigation strategies into the general operations of the Cities and partner organizations. After conducting a risk assessment (Section 3: Risk Assessment), the Subcommittees will identify additional policies, programs, practices, and procedures that could be modified to address mitigation

activities. In addition, the Cities intend to implement the plan through its involvement in FEMA and Cal OES programs. Table 10-3: Existing Processes and Programs identify existing opportunities through which the Plan can be implemented.

**Table 10-3: Existing Processes and Programs**

| Process        | Action  | Implementation of Plan  |
|----------------|---|---|
| Administrative | Departmental or organizational work plans, policies, and procedural changes | <ul style="list-style-type: none"> <li>✓ <i>City Manager's Office</i></li> <li>✓ <i>Planning Department</i></li> <li>✓ <i>Public Works Department</i></li> <li>✓ <i>Other departments as appropriate</i></li> </ul>   |

**In addition to being required by DMA 2000, adoption of the plan is necessary because:**

- It lends authority to the plan to serve as a guiding document for all local and state government officials;
- It gives legal status to the plan in the event it is challenged in court;
- It certifies to program and grant administrators that the plan's recommendations have been properly considered and approved by the governing authority and jurisdictions' citizens; and
- It helps to ensure the continuity of mitigation programs and policies over time because elected officials, staff, and other community decision-makers can refer to the official document when making decisions about the community's future.

Source: FEMA. 2003. "How to Series" - *Bringing the Plan to Life* (FEMA 386-4)

## Use of Existing Data

The Planning Team gathered and reviewed existing data and plans during plan development. Numerous electronic and hard copy documents were used to support the planning process:

- ✓ City of Rancho Palos Verdes General Plan
- ✓ City of Rolling Hills Estates General Plan
- ✓ County of Los Angeles General Plan, (Draft 2014)
- ✓ County of Los Angeles All-Hazards Mitigation Plan, (2014)
- ✓ HAZUS maps reports (included in this update to the Hazard Mitigation Plan)
- ✓ Historic GIS maps and local inventory data

These documents are updated as needed to reflect the mitigation strategies identified in Section 9: Mitigation Strategies.

## Federal Data

A variety of federal data was collected and used throughout the mitigation planning process:

- ✓ Census data
- ✓ FEMA "How To" Mitigation Series (386-1 to 386-9)
- ✓ National Oceanic and Atmospheric Administration Statistics

The Planning Team also examined public laws and programs (such as the National Flood Insurance Program) during plan development.

A list of existing data and plans used to support the mitigation planning effort appears in Appendix A: Resource Directory. The length of this list demonstrates the importance of mitigation planning in existing programs. Implementing the plan through existing programs is identified as a mitigation action in Section 9: Mitigation Strategies. A description of the implementation process and potential funding sources is provided.

## Plan Adoption

The Planning Team chose to send the 2014 Plan first to Cal OES and FEMA for a joint review and conditional approval prior to distributing the Final Draft Plan for external review and presentation to the City Councils for adoption.

Adoption of the plan by the City Councils demonstrates the Cities' commitment to meeting mitigation goals and objectives. A governing body's adoption legitimizes the plan and authorizes responsible entities within the Cities to execute their responsibilities. The resolution of adoption by each City Council is located in Section 10: Planning Process.

## Public Meetings

The City of Rancho Palos Verdes and the City of Rolling Hills Estates conducted a public review period and incorporated any gathered comments prior submission of the Final Draft Plan to the City Councils. In both cases, the Planning Team representatives prepared a staff report outlining the planning process and presented the Plan during the following public meetings:

### **City of Rancho Palos Verdes**

On June 21, 2012, the City's Emergency Planning Committee was briefed on the Second Draft Plan and informed they would be provided access to the Final Draft Plan and that their input would be welcomed.

On December 3, 2013, the Rancho Palos Verdes City Council heard the item and voted to adopt the Plan.

### **City of Rolling Hills Estates**

On January 14, 2014, the Rolling Hills Estates City Council heard the item and voted to adopt the Plan.

## Invitation Process

The Planning Team identified possible public notice sources. The Agenda Item concerning this Plan was posted on both of the websites. In addition, it was posted at both City Halls and each of the City Libraries. On October 31, 2013, the City of Rancho Palos Verdes distributed an email on its "Breaking News List Serve" to 2,183 registries and to the Emergency Planning Committee List Serve 554 registries announcing the availability of the Plan during the plan writing phase and again during the review and noticing associated with the City Council meeting.

## Attachment 10-1: City Council Resolutions

### Rancho Palos Verdes

#### RESOLUTION NO. 2013-78

#### A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF RANCHO PALOS VERDES ADOPTING THE 2013 ALL HAZARDS MULTIJURISDICTIONAL MITIGATION PLAN.

**WHEREAS**, the federal Disaster Management Act of 2000 ("DMA2K"), which amended the Robert T. Stafford Disaster Relief and Emergency Services Act, requires all government agencies to have an approved All Hazards Multijurisdictional Mitigation Plan ("Plan") in order to be eligible for future mitigation funding from the Federal Emergency Management Agency (FEMA) in the event of a natural disaster; and,

**WHEREAS**, the City is interested in protecting the safety and welfare of its citizens and infrastructure in the event of a natural, technological and/or human caused disaster and wishes to comply with the requirements of DMA2K; and,

**WHEREAS**, the City has prepared a Plan in partnership with the City of Rolling Hills Estates that focuses on potential impacts of earthquakes, wildfires, earth movement, and tsunami, and includes an assessment of these natural hazards, a plan to mitigate them, and methods of monitoring, evaluating the plan on a semi-annual basis, and updating the Plan at least every five years; and,

**WHEREAS**, the City has used a variety of methods to educate the public about the need to mitigate for natural disasters, as well as to solicit public input during the Plan preparation and approval process. Further, the RPV Emergency Preparedness Committee reviewed the Plan at a public meeting held on November 21, 2013, and forwarded recommended changes, clarifications and revisions to the document to the City Council for consideration of adoption.

#### **NOW, THEREFORE, THE CITY COUNCIL OF THE CITY OF RANCHO PALOS VERDES DOES HEREBY FIND, DETERMINE AND RESOLVE AS FOLLOWS:**

Section 1: That the Joint Natural Hazards Mitigation Plan is an important document for the safety and security of the City.

Section 2: That the City Council hereby adopts the Plan, a copy of which is attached hereto as Exhibit "A" and incorporated herein by this reference..

Section 3: The City Manager's Office shall submit this Resolution to (FEMA) along with the adopted Plan for final Plan approval,

Section 4: The City Clerk shall certify to the passage and adoption of this Resolution.

PASSED, APPROVED, and ADOPTED this 3rd day of December 2013.

  
Mayor

ATTEST:

Good Morning!

The City of Rancho Palos Verdes requests that you please review the latest edition of our Plan (see attachment). You can find the Plan on our websites: <http://www.palosverdes.com/rpv/> in the "Spotlight" section (lower right corner), [http://www.palosverdes.com/rpv/emergency\\_preparedness/](http://www.palosverdes.com/rpv/emergency_preparedness/) (lower section of the webpage) or review a hardcopy at the front desk of our City Hall located at 30940 Hawthorne Blvd., Rancho Palos Verdes, CA 90275.

Please let me know if you have any questions.

Thanks!

## DRAFT ALL HAZARDS MULTIJURISDICTIONAL MITIGATION PLAN

Staff recently completed the Draft Multijurisdictional Hazard Mitigation Plan (Plan) and is preparing to circulate it for public comment. The Plan was prepared in response to the Disaster Mitigation Act of 2000 (DMA 2000) and is an update to the 2004 Joint Natural Hazards Mitigation Plan prepared cooperatively with the City of Rolling Hills Estates. The 2013 Plan satisfies both RPV and RHE's mitigation planning requirements by identifying hazards, potential losses, mitigation needs, goals, and strategies. The action items address multi-hazard issues, as well as activities for earthquake, wildfire, earth movement (landslide & debris flow), tsunami, and technological and human-caused hazards. This type of planning supplements each city's comprehensive emergency management programs.

The Draft Plan will be available for review by the public and private stakeholders from **November 4, 2013 through November 15, 2013**. The electronic version of the Plan will be available for review on the RPV home page and the Emergency Preparedness Committee (EPC) web page, and a hardcopy will be available at the front counter of the RPV City Hall reception area. Availability of the Draft Plan will be announced through a press release to the Daily Breeze, Peninsula News, PVPatch, the EPC and Breaking News ListServes, and the Channel 33 & 38 news scroll.

The Plan, which will be reviewed by the EPC and recommended for City Council approval at the EPC's November 21, 2013 meeting, is tentatively scheduled to be presented to City Council on December 17, 2013. The adopted Plan must be submitted to the Federal Emergency Management Agency (FEMA) by January 28, 2014.

For more information, please contact Tracy Bonano, RPV Emergency Services Coordinator, at: 310-544-5209 or [tracyb@rpv.com](mailto:tracyb@rpv.com)

## MEMORANDUM

**TO: HONORABLE MAYOR AND CITY COUNCIL**  
**FROM: CAROLYN LEHR, CITY MANAGER** *(Signature)*  
**DATE: OCTOBER 30, 2013**  
**SUBJECT: WEEKLY ADMINISTRATIVE REPORT**

### PUBLIC HEARING ON PONTE VISTA PROJECT

On October 23, 2013, the City was officially notified of the upcoming hearing on the *Ponte Vista* project before the Los Angeles City Planning Commission (CPC). A copy of the hearing notice is attached. **The hearing will be at 8:30 AM on Thursday, November 14, 2013, at Los Angeles City Hall in Downtown Los Angeles.** The CPC will be asked to consider certifying the Final EIR; approving a General Plan Amendment, Zone Change and Code Amendment; and establishing the *Ponte Vista* at San Pedro Specific Plan for the 61.5-acre former Navy housing site at 26900 Western Avenue. Please see the attached notice for information about attending the hearing and submitting written comments.

### ELECTION NIGHT SEMI-OFFICIAL ELECTION RESULTS INFORMATION

Election night results will be available on the LA County Registrar-Recorder/County Clerk's (RR/CC) website at [www.lavote.net](http://www.lavote.net). Preliminary Vote by Mail ballot results will be available at approximately 8:30 p.m. on Election night. As precinct ballots arrive during the evening, updated cumulative election results will be available and posted on the City's website via our link to the LA County RR/CC's website. To access the results, simply click on the "Vote" button on the City's home page, which will take you to the General Municipal Election page. A link to the LA County RR/CC's website is in the upper right corner along with other election related links.

### MONTHLY EMERGENCY PREPAREDNESS MESSAGE – NOVEMBER 2013

November 2013 EMERGENCY PREPAREDNESS MESSAGE: "Shelter in Place or Evacuate" – When things start to shake and you begin to debate, know what is best for you and your family; stay or go?

#### What Shelter-in-Place Means:

One of the instructions you may be given in an emergency where hazardous materials may have been released into the atmosphere is to shelter-in-place. This is a precaution aimed to keep you safe while remaining indoors. (This is not the same thing as going to

City Manager  
October 30, 2013  
Page 2

a shelter in case of a storm.) Shelter-in-place means selecting a small, interior room, with no or few windows, and taking refuge there until further instructions are provided by authorities.

**Why You Might Need to Shelter-in-Place:**

Chemical, biological, or radiological contaminants may be released accidentally or intentionally into the environment. Should this occur, information will be provided by local authorities on television and radio stations on how to protect you and your family. Because information will most likely be provided on television and radio, it is important to keep a TV or radio on, even during the workday. The important thing is for you to

follow instructions of local authorities and know what to do if they advise you to shelter-in-place.

For more information go to: [www.espfocus.org](http://www.espfocus.org) or contact Tracy Bonano, Rancho Palos Verdes Emergency Services Coordinator, at 310-544-5209 or [tracyb@rpv.com](mailto:tracyb@rpv.com)

**DRAFT ALL HAZARDS MULTIJURISDICTIONAL MITIGATION PLAN**

Staff recently completed the Draft Multijurisdictional Hazard Mitigation Plan (Plan) and is preparing to circulate it for public comment. The Plan was prepared in response to the Disaster Mitigation Act of 2000 (DMA 2000) and is an update to the 2004 Joint Natural Hazards Mitigation Plan prepared cooperatively with the City of Rolling Hills Estates. The 2013 Plan satisfies both RPV and RHE's mitigation planning requirements by identifying hazards, potential losses, mitigation needs, goals, and strategies. The action items address multi-hazard issues, as well as activities for earthquake, wildfire, earth movement (landslide & debris flow), tsunami, and technological and human-caused hazards. This type of planning supplements each city's comprehensive emergency management programs.

The Draft Plan will be available for review by the public and private stakeholders from **November 4, 2013 through November 15, 2013**. The electronic version of the Plan will be available for review on the RPV home page and the Emergency Preparedness Committee (EPC) web page, and a hardcopy will be available at the front counter of the RPV City Hall reception area. Availability of the Draft Plan will be announced through a press release to the Daily Breeze, Peninsula News, PVPatch, the EPC and Breaking News ListServes, and the Channel 33 & 38 news scroll.

The Plan, which will be reviewed by the EPC and recommended for City Council approval at the EPC's November 21, 2013 meeting, is tentatively scheduled to be presented to City Council on December 17, 2013. The adopted Plan must be submitted to the Federal Emergency Management Agency (FEMA) by January 28, 2014.

For more information, please contact Tracy Bonano, RPV Emergency Services Coordinator, at: 310-544-5209 or [tracyb@rpv.com](mailto:tracyb@rpv.com)

## RPV City Council Report

### MEMORANDUM

**TO:** HONORABLE MAYOR AND CITY COUNCIL

**FROM:** CAROLYNN PETRU, DEPUTY CITY MANAGER 

**DATE:** DECEMBER 3, 2013

**SUBJECT:** DRAFT 2013 RANCHO PALOS VERDES/ROLLING HILLS ESTATES (RPV/RHE) ALL HAZARDS MULTIJURISDICTIONAL MITIGATION PLAN

**REVIEWED:** CAROLYN LEHR, CITY MANAGER 

Staff Coordinator: Tracy Bonano, Senior Administrative Analyst 

### RECOMMENDATION

Adopt Resolution No. 2013 – \_\_; a resolution of the City Council of the City of Rancho Palos Verdes adopting the 2013 All Hazards Multijurisdictional Mitigation Plan, as presented.

### BACKGROUND

The City is exposed to hazards such as earthquakes, wildfire, earth movement, tsunami, and technological and human-caused hazards. The federal Disaster Mitigation Act of 2000 required local jurisdictions to adopt mitigation plans to reduce the risks associated with such occurrences.

The current Rancho Palos Verdes and Rolling Hills Estates Joint Natural Hazards Mitigation Plan was adopted by the Rancho Palos Verdes City Council on October 4, 2004. An updated Plan is required not only to further reduce risk to the community, but to maintain eligibility for disaster mitigation funding from FEMA. Therefore, the City hired a consultant to guide the City staff through the process using the most current FEMA Local Mitigation Plan Review Tool. As was the case with the 2004 Plan, development of the 2013 Plan was a joint effort between the Cities of Rancho Palos Verdes and Rolling Hills Estates.

6-1

Topic: Draft 2013 RPV/RHE All Hazards Multijurisdictional Mitigation Plan

Date: December 3, 2013

Page 2

## **DISCUSSION**

To facilitate the preparation of the 2013 Plan, a RPV/RHE Hazard Mitigation Planning Team was formed consisting of City Staff from the City Manager's Office, Community Development Department/Building & Safety Division, Finance/Information Technology Department, Public Works Department, Los Angeles County Fire Department, Area G Disaster Management Area, contracted information/technology staff, as well as other federal, state, local and public stakeholders. The Draft 2013 All Hazards Multijurisdictional Mitigation Plan (Plan) developed through this effort was submitted to the California Office of Emergency Services (Cal OES) and then to FEMA for review and approval. The Plan was returned from FEMA with minor revisions that the City's consultant has corrected. Final approval from FEMA is pending, as FEMA typically requires the Plan to be adopted by the jurisdiction's City Council before it provides final approval. The Draft 2013 Plan was made available for public review for two weeks (November 4, 2013 through November 15, 2013) using:

- The City Manager's Weekly Report to City Council;
- The City and Emergency Preparedness Committee websites;
- A hard copy available at the main reception counter at City Hall;
- An emailed invitation to stakeholders such as - the Cities of Palos Verdes Estates, Rolling Hills, Rolling Hills Estates, LACoFD, LASD, Verizon, Edison, Gas, Cal Water, the Area G Disaster Management Area Coordinator, and the PVP Chamber of Commerce;
- A Channel 33 News scroll;
- An advertisement in the Daily Breeze classified section; and
- Exposure on the City's Breaking News and Emergency Preparedness Committee ListServe outlets.

The Draft Plan was presented to the Emergency Preparedness Committee (EPC) at their November 21, 2013 meeting for review and comment. The EPC recommended that the Plan be forwarded to City Council for adoption. To date, no public comments have been received regarding the Plan.

## **CONCLUSION**

The Palos Verdes Peninsula is exposed to a variety of potential hazards, both natural and man-made. Adopting and maintaining a multijurisdictional hazard mitigation plan is an essential part of reducing the risk of these hazards to the community. In addition, it ensures that the City will remain eligible for FEMA disaster mitigation funding under the Disaster Act of 2000, which includes funding for updating the Plan. Based on these factors, it is in the best interest of the City to adopt the updated 2013 Draft Plan and continue with the effort to keep it up to date.

## **ALTERNATIVES**

1. Provide staff with direction on revisions to the Draft Plan and continue the item to a future meeting.

6-2

**Topic: Draft 2013 RPV/RHE All Hazards Multijurisdictional Mitigation Plan**  
**Date: December 3, 2013**  
**Page 3**

2. Do not adopt the Plan.

**FISCAL IMPACT**

There is no direct fiscal impact to the City. However, failure to adopt the resolution could affect the City's eligibility for FEMA disaster mitigation funding.

## RHE City Council Staff Report

# Staff Report

**DATE:** JANUARY 14, 2014

**TO:** MAYOR AND CITY COUNCIL

**FROM:** GREG GRAMMER, ASSISTANT CITY MANAGER  
NIKI WETZEL, AICP, PRINCIPAL PLANNER

**SUBJECT:** DRAFT 2013 RANCHO PALOS VERDES/ROLLING HILLS ESTATES  
MULTIJURISDICTIONAL HAZARD MITIGATION PLAN

### OVERVIEW:

Attached for City Council review and approval is the 2013 Multijurisdictional Hazard Mitigation Plan, as required by the Federal Emergency Management Agency (FEMA) in accordance with the Disaster Mitigation Act of 2000, for the cities of Rolling Hills Estates and Rancho Palos Verdes.

### BACKGROUND AND DISCUSSION:

The City is exposed to hazards such as earthquakes, wildfire, earth movement, tsunami, and technological and human-caused hazards. The federal Disaster Mitigation Act of 2000 required local jurisdictions to adopt mitigation plans to reduce the risks associated with such occurrences.

The current Rancho Palos Verdes and Rolling Hills Estates Joint Natural Hazards Mitigation Plan was adopted by the Rolling Hills Estates City Council on September 28 2004. An updated Plan is required not only to further reduce risk to the community, but to maintain eligibility for disaster mitigation funding from FEMA. Therefore, the City hired a consultant, Carolyn Harshman, Emergency Planning Consultants, to guide City staff through the process using the most current FEMA Local Mitigation Plan Review Tool. As was the case with the 2004 Plan, development of the 2013 Plan was a joint effort between the Cities of Rolling Hills Estates and Rancho Palos Verdes.

To facilitate the preparation of the 2013 Plan, a RPV/RHE Hazard Mitigation Planning Team was formed consisting of staff members from both cities, as well as other state,

local and public stakeholders. The Draft 2013 All Multijurisdictional Hazard Mitigation Plan developed through this effort was submitted to the California Office of Emergency Services (Cal OES) and then to FEMA for review and approval. The Plan was returned from FEMA with minor revisions that the City's consultant has made. Final approval from FEMA is pending, as FEMA typically requires the Plan to be adopted by the jurisdiction's City Council before it provides final approval.

The Draft 2013 Plan was made available for public review starting on December 20, 2013 using:

- City Website - posted on the homepage under Community News & Updates and on the Emergency Preparedness page;
- Social Media - posted on Nextdoor;
- City Hall - a hard copy available at the main reception counter at City Hall;
- Email - notification was sent to stakeholders including the cities of Palos Verdes Estates Rolling Hills, Rancho Palos Verdes, Palos Verdes Peninsula Unified School District, Los Angeles County Fire Department, Los Angeles County Sheriff's Department, Area G Disaster Management Coordinator, Southern California Edison, The Gas Company, Cal Water, AT&T, Verizon, and the Palos Verdes Peninsula Chamber of Commerce, as well as Peninsula News and Palos Verdes Patch

To date, no public comments have been received regarding the draft Plan. The City of Rancho Palos Verdes approved the Plan at its meeting on December 3, 2013.

Our consultant will be in attendance at the City Council meeting to provide a brief presentation and answer any questions.

#### **RECOMMENDATION:**

Staff recommends that the City Council approve Resolution No. 2315, adopting the updated 2013 Rancho Palos Verdes/Rolling Hills Estates Multijurisdictional Hazard Mitigation Plan.

## RHE City Council Minutes

### MINUTES RANCHO PALOS VERDES CITY COUNCIL REGULAR MEETING DECEMBER 3, 2013

The meeting was called to order at 6:00 P.M. by Mayor Brooks at Fred Hesse Community Park, 29301 Hawthorne Boulevard, and was immediately recessed into Closed Session. The meeting reconvened at 7:03 P.M.

City Council roll call was answered as follows:

**PRESENT:** Campbell, Duhovic, Knight, Missetich and Mayor Brooks  
**ABSENT:** None

Also present were Carolyn Lehr, City Manager; Carolynn Petru, Deputy City Manager; Carol Lynch, City Attorney; Dennis McLean, Director of Finance/Information Technology (IT); Joel Rojas, Community Development Director; Cory Linder, Director of Recreation and Parks; Les Jones, Interim Director of Public Works; Kathryn Downs, Deputy Director of Finance/IT; Nicole Jules, Senior Engineer; Sean Robinson, Human Resources Manager; Mike Gibson, Senior Administrative Analyst; Tracy Bonano, Senior Administrative Analyst; Lauren Ramezani, Senior Administrative Analyst; Ryan Mills, Senior Administrative Analyst; and, Carla Morreale, City Clerk.

Also present were the following: Timothy Schaefer, President, Magis Consulting Services; and, Carolyn Harshman, Consultant, Emergency Planning Consultants.

#### FLAG SALUTE:

The Flag Salute was led by Juan Forteza.

#### MAYOR'S ANNOUNCEMENTS:

Mayor Brooks presented Florence McTaggart with a plaque in commemoration of the dedication of the Hesse Park Council Chambers as the John C. McTaggart Memorial Hall and Council Chambers in honor of former Mayor and Councilman John C. McTaggart. She provided a brief synopsis of John McTaggart's service to the City, noting he was the longest serving elected official in the City's 40-year history.

#### CERTIFICATION OF ELECTION:

Mayor Brooks thanked her colleagues, staff, City Advisory Board Members, and the residents and provided a commentary highlighting events and projects of the past year.

City Council Minutes  
December 3, 2013  
Page 1 of 11

Mayor Pro Tem Duhovic thanked Mayor Brooks for her work this past year and presented her with a gavel and framed 40<sup>th</sup> Anniversary photograph for her past year of service as Mayor of the City.

Councilman Misetich, Councilman Knight, and Councilman Campbell thanked Mayor Brooks for her countless hours and hard work as Mayor over the past year.

#### **Certification of Election Results**

City Clerk Morreale provided a brief report regarding the Certification of Election results declaring Anthony Misetich and Brian Campbell as the newly elected Council Members as a result of the November 5, 2013 General Municipal Election.

Councilman Knight moved, seconded by Mayor Pro Tem Duhovic, to approve the staff recommendation to certify the Election results and ADOPT RESOLUTION NO. 2013-73, A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF RANCHO PALOS VERDES, RECITING THE FACTS OF THE GENERAL MUNICIPAL ELECTION HELD IN SAID CITY ON NOVEMBER 5, 2013, DECLARING THE RESULTS THEREOF AND SUCH OTHER MATTERS AS PROVIDED BY LAW.

The motion passed on the following roll call vote:

|                |   |
|----------------|---|
| <b>AYES:</b>   | Campbell, Duhovic, Knight, Misetich, and Mayor Brooks |
| <b>NOES:</b>   | None  |
| <b>ABSENT:</b> | None  |

#### **Swearing in and Seating of Newly Elected Council Members Campbell and Misetich**

City Clerk Morreale administered the Oath of Office to newly elected Council Members Brian Campbell and Anthony Misetich.

#### **COUNCIL REORGANIZATION:**

##### **Selection of Mayor**

City Clerk Morreale called for nominations for the selection of Mayor.

Councilman Knight nominated Mayor Pro Tem Duhovic for Mayor. Councilman Misetich seconded the motion.

The motion carried on the following roll call vote:

|                |  |
|----------------|--|
| <b>AYES:</b>   | Campbell, Duhovic, Knight, Misetich and Mayor Brooks |
| <b>NOES:</b>   | None   |
| <b>ABSENT:</b> | None   |

City Council Minutes  
December 3, 2013  
Page 2 of 11

### **Selection of Mayor Pro Tem**

Mayor Duhovic called for nominations for the selection of Mayor Pro Tem.

Councilwoman Brooks nominated Councilman Knight to serve as Mayor Pro Tem. Councilman Campbell seconded the motion.

The motion carried on the following roll call vote:

|                |   |
|----------------|---|
| <b>AYES:</b>   | Brooks, Campbell, Knight, Misetich, and Mayor Duhovic |
| <b>NOES:</b>   | None  |
| <b>ABSENT:</b> | None  |

Mayor Duhovic thanked Councilwoman Brooks for her service as Mayor over the past year and congratulated Mayor Pro Tem Knight for his appointment as the new Mayor Pro Tem. He provided a brief overview of his top goals and priorities, as well as the projects and issues facing the City over the coming year; thanked his family and friends for their support; and thanked the residents for their continued involvement with the City.

Mayor Pro Tem Knight thanked his colleagues for their vote of confidence and stated that he looks forward to a productive coming year as the Council continues to work together for the best interests of the residents of the City.

Councilwoman Brooks, Councilman Campbell, and Councilman Misetich provided brief remarks regarding the coming year and opportunity to continue serving the residents of the City of Rancho Palos Verdes. Newly elected Councilman Campbell and Councilman Misetich thanked their family, friends, and the residents for electing them as Council Members for another four years of service.

Councilwoman Brooks passed on the oversized gavel to Mayor Duhovic as he begins his yearlong service as Mayor.

### **RECESS/RECEPTION:**

Mayor Duhovic declared a brief recess from 8:05 P.M. to 8:31 P.M.

### **RECYCLE AND EMERGENCY PERSONAL PREPAREDNESS KIT DRAWING:**

Mayor Duhovic announced Recyclers of the Month from the November 19, 2013 City Council meeting: Phillip Rubaloff and Leatrice Osofsky. He indicated that all winners receive a check for \$250 representing a year of free refuse service and urged everyone to participate in the City's Recycling Program. He noted that in addition to winning the Recycler Drawing, the two individuals had also won a Personal Emergency Preparedness Kit from the City at a value of \$60.00.

City Council Minutes  
December 3, 2013  
Page 3 of 11

#### **APPROVAL OF THE AGENDA:**

Mayor Pro Tem Knight suggested that Item No. 7 (Certificate of Deposit Account Registry Service Agreement) be moved up on the agenda to be considered before the Public Hearing.

Mayor Pro Tem Knight moved, seconded by Councilwoman Brooks, to approve the agenda, as amended, with Item No. 7 (Certificate of Deposit Account Registry Service Agreement) moved up on the agenda prior to the Public Hearing.

The motion passed on the following roll call vote:

**AYES:** Brooks, Campbell, Knight, Misetich and Mayor Duhovic  
**NOES:** None  
**ABSENT:** None

#### **PUBLIC COMMENTS: (Audience Comments regarding Items Not on the Agenda)**

None.

#### **CITY MANAGER REPORT:**

Deputy City Manager Petru announced that the Lomita Sheriff's Station will be sponsoring the annual "Santa's Sleigh" event through some of the local Rancho Palos Verdes neighborhoods December 4<sup>th</sup> through 22<sup>nd</sup>.

Director of Recreation and Parks Linder announced the upcoming "Breakfast with Santa" event to be held on Saturday, December 14, 2013 at Hesse Park.

City Manager Lehr announced that staff from the Public Works and Community Development Departments with assistance from the City Attorney's Office will be creating a new City library of reference materials regarding the Landslide Area along Palos Verdes Drive South.

#### **NEW BUSINESS:**

#### **APPROVAL OF CONSENT CALENDAR:**

City Clerk Morreale reported that late correspondence regarding Item C (Border Issues Status Report), Item D (Adoption of Ordinance No. 552 - Code Amendment to Chapter 15.20 Moratorium on Land Use Permits), Item H (Adoption of Revised Salary and Hourly Schedule for the Competitive, Management and Part-Time Positions) and Item K (Palos Verdes Nature Preserve – Palos Verdes Peninsula Land Conservancy 2010-2012

City Council Minutes  
December 3, 2013  
Page 4 of 11

Cumulative Report and 2012 Annual Report) was distributed prior to the meeting, and there were no requests to speak on Consent Calendar items.

Mayor Pro Tem Knight stated that he would like Item D (Adoption of Ordinance No. 552 - Code Amendment to Chapter 15.20 Moratorium on Land Use Permits) removed from the Consent Calendar for a separate vote as he would be recusing himself from voting on that item.

Councilman Campbell requested that Item H (Adoption of Revised Salary and Hourly Schedule for the Competitive, Management and Part-Time Positions) be removed from the Consent Calendar for separate consideration.

Councilwoman Brooks moved, seconded by Mayor Pro Tem Knight, to approve the Consent Calendar, as amended, with Item No. D (Adoption of Ordinance No. 552 - Code Amendment to Chapter 15.20 Moratorium on Land Use Permits) removed from the Consent Calendar to be voted on separately; and Item H (Adoption of Revised Salary and Hourly Schedule for the Competitive, Management and Part-Time Positions) removed from the Consent Calendar and to be heard after the Regular Business items.

The motion passed on the following roll call vote:

**AYES:** Brooks, Campbell, Knight\*, Misetich and Mayor Duhovic  
**NOES:** None  
**ABSENT:** None

\*Mayor Pro Tem Knight voted no on Item F.

#### **Motion to Waive Full Reading**

Adopted a motion to waive reading in full of all ordinances presented at this meeting with consent of the waiver of reading deemed to be given by all Council Members after the reading of the title.

#### **Approval of Minutes**

Approved the Minutes of the November 6, 2013 Regular Meeting.

#### **Border Issues Status Report**

Received and filed the current report on the status of Border Issues.

**Adoption of Ordinance No. 552 - Code Amendment to Chapter 15.20 (Moratorium on Land Use Permits) of the Rancho Palos Verdes Municipal Code to Establish an Exception Category to Allow Minor, Non-Remedial Grading on Lots Developed with**

**a Residential Structure or Other Lawfully Existing Non-Residential Structure within the City's Landslide Moratorium Area**

This item was removed from the Consent Calendar for separate consideration.

**Approval of Annual Commercial Haulers Agreements for 2014**

1) Authorized the Mayor to execute one-year non-exclusive commercial refuse collection and disposal services agreements for 2014 with eight companies: California Waste Services LLC; CalMet Services, Inc.; Consolidated Disposal Service, LLC; Easy Roll Off Services; EDCO Disposal Corporation; Universal Waste Systems, Inc.; USA Waste of California, Inc., dba Waste Management of Los Angeles; and West Coast Waste & Roll Off Service; and, 2) ADOPTED RESOLUTION NO. 2013-74, A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF RANCHO PALOS VERDES, LIMITING THE NUMBER OF HAULERS AUTHORIZED TO PROVIDE SOLID WASTE COLLECTION AND RECYCLING SERVICES FROM COMMERCIAL PREMISES, AND ROLL OFF SERVICES TO RESIDENTIAL AND COMMERCIAL PREMISES IN THE CITY OF RANCHO PALOS VERDES IN CALENDAR YEAR 2014.

**Amendment to a Special Use Permit at Green Hills Memorial Park (Planning Case No. ZON2010-00366)**

ADOPTED RESOLUTION NO. 2013-75, A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF RANCHO PALOS VERDES, THEREBY MEMORIALIZING THE CITY COUNCIL'S DECISION MADE ON NOVEMBER 19, 2013 TO EXTEND APPROVAL OF GREEN HILLS MEMORIAL PARK'S CURRENT SPECIAL USE PERMIT FOR USE OF TWO TEMPORARY MODULAR BUILDINGS FOR ONE ADDITIONAL YEAR SO THAT THE APPLICANT CAN OBTAIN ALL THE NECESSARY CITY APPROVALS AND PERMITS FOR PERMANENT BUILDINGS IN LIEU OF THE TWO TEMPORARY MODULAR BUILDINGS (PLANNING CASE NO. 2010-00366).

**Adoption of Ordinance No. 553 – Amendment to Municipal Code Sections 8.20.250, 8.20.220 and 8.24.060(A)(2) Making Minor Amendments to the Regulations regarding Residential Trash Containers**

ADOPTED ORDINANCE NO. 553, AN ORDINANCE OF THE CITY OF RANCHO PALOS VERDES, AMENDING THE RANCHO PALOS VERDES MUNICIPAL CODE REGARDING TRASH CONTAINERS.

**Adoption of Revised Salary and Hourly Schedule for the Competitive, Management and Part-Time Positions**

This item was removed from the Consent Calendar for separate consideration.

City Council Minutes  
December 3, 2013  
Page 6 of 11

**Register of Demands**

ADOPTED RESOLUTION NO. 2013-76, A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF RANCHO PALOS VERDES, ALLOWING CERTAIN CLAIMS AND DEMANDS AND SPECIFYING FUNDS FROM WHICH THE SAME ARE TO BE PAID.

**October 2013 Monthly Report of Cash Balances**

Received and filed the October 2013 Monthly Report of Cash Balances for the City of Rancho Palos Verdes.

**Palos Verdes Nature Preserve – Palos Verdes Peninsula Land Conservancy 2010-2012 Cumulative Report and 2012 Annual Report (Supports 2013 City Council Goal-Trail System Enhancement)**

Received and filed the 2010-2012 Cumulative Report and the 2012 Annual Report submitted by the Palos Verdes Peninsula Land Conservancy on its management activities for the Palos Verdes Nature Preserve.

# # # # # #

**ITEM(S) REMOVED FROM THE CONSENT CALENDAR:**

**Adoption of Ordinance No. 552 - Code Amendment to Chapter 15.20 (Moratorium on Land Use Permits) of the Rancho Palos Verdes Municipal Code to Establish an Exception Category to Allow Minor, Non-Remedial Grading on Lots Developed with a Residential Structure or Other Lawfully Existing Non-Residential Structure within the City's Landslide Moratorium Area**

Mayor Pro Tem Knight stated that he would be recusing himself from discussion of this item and left the dais at 8:44 P.M.

Councilwoman Brooks moved, seconded by Councilman Misetich, to approve the staff recommendation to: ADOPT ORDINANCE NO. 552, AN ORDINANCE OF THE CITY OF RANCHO PALOS VERDES, ADOPTING AMENDMENTS TO CHAPTER 15.20 (MORATORIUM ON LAND USE PERMITS) OF THE RANCHO PALOS VERDES MUNICIPAL CODE TO ESTABLISH AN EXCEPTION CATEGORY TO ALLOW MINOR, NON-REMEDIAL GRADING ON LOTS DEVELOPED WITH A RESIDENTIAL STRUCTURE OR OTHER LAWFULLY EXISTING NONRESIDENTIAL STRUCTURE WITHIN THE CITY'S LANDSLIDE MORATORIUM AREA.

The motion passed on the following roll call vote:

**AYES:** Brooks, Campbell, Misetich and Mayor Duhovic  
**NOES:** None

City Council Minutes  
December 3, 2013  
Page 7 of 11

**ABSENT:** Knight (recused)

Mayor Pro Tem Knight returned to the dais at 8:45 P.M.

**REGULAR BUSINESS:**

**Certificate of Deposit Account Registry Service (CDARS) Agreement**

Director of Finance/IT McLean provided a staff report and PowerPoint presentation regarding this item.

Timothy Schaefer, President, Magis Consulting Services and the City's Investment Advisor, answered questions posed by Council Members. Mr. Schaefer addressed the following fiduciary duties that needed to be satisfied prior to presenting this item to the Council for approval: 1) good internal controls; 2) good understanding of the investment risks and opportunities that will be presented; and, 3) proper vetting with the City Attorney since this project is dealing with public funds. He added that it is prudent to begin with a smaller amount of money in the CDARS program, until making certain that the systems are all working properly, and then expand the program once the mechanical features of internal controls are working correctly.

Discussion ensued among Council Members, staff, and City Attorney Lynch.

Councilwoman Brooks moved, seconded by Councilman Campbell, to approve the staff recommendation to: 1) Approve form of the Certificate of Deposit Account Registry Service (CDARS) agreement through Promontory Interfinancial Network; 2) Approve form of the Custodial Agreement with Malaga Bank; and, 3) ADOPT RESOLUTION NO. 2013-77, A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF RANCHO PALOS VERDES, APPROVING THE FORM CDARS AGREEMENT AND CUSTODIAL AGREEMENT, DIRECTING THE MAYOR TO SIGN THE CDARS AGREEMENT AND CUSTODIAL AGREEMENT WITH MALAGA BANK, AND DESIGNATING THE CITY MANAGER, CITY TREASURER AND DEPUTY CITY MANAGER AS SIGNATORIES TO EXECUTE ANY SUBORDINATE AGREEMENTS AND OTHER DOCUMENTS TO IMPLEMENT THE CDARS PROGRAM.

The motion passed on the following roll call vote:

**AYES:** Brooks, Campbell, Knight, Missetich and Mayor Duhovic  
**NOES:** None  
**ABSENT:** None

**PUBLIC HEARINGS:**

**Draft Mitigated Negative Declaration for the Marymount Athletic Field Expansion Project (Location: Marymount California University, 30800 Palos Verdes Drive East)**

City Council Minutes  
December 3, 2013  
Page 8 of 11

City Clerk Morreale reported that notice of the public hearing was duly published, written protests included with late correspondence distributed prior to the meeting, and there were no requests to speak regarding this item.

Mayor Duhovic declared the public hearing open.

Councilman Misetich moved, seconded by Councilwoman Brooks, to approve the staff recommendation to: Continue the public meeting for the sole purpose of obtaining comments on the Draft Mitigated Negative Declaration to the January 21, 2014 City Council meeting.

The motion passed on the following roll call vote:

**AYES:** Brooks, Campbell, Knight, Misetich and Mayor Duhovic  
**NOES:** None  
**ABSENT:** None

**REGULAR BUSINESS (continued):**

**Proposed FY 2014-15 Community Development Block Grant (CDBG) Program**

City Clerk Morreale reported there were no requests to speak regarding this item.

Senior Administrative Analyst Gibson provided a brief staff report and PowerPoint presentation regarding this item.

Discussion ensued among Council Members and staff.

Councilwoman Brooks moved, seconded by Mayor Pro Tem Knight, to adopt the staff recommendation to: 1) Approve the proposed CDBG project and budget; 2) Authorize the Director of Public Works to execute an agreement for the CDBG project with the Los Angeles County Community Development Commission (LACDC); and, 3) Authorize the Director of Public Works to adjust the program budget, as necessary, to take into account the final CDBG allocation and any amounts unexpended at the close of the current fiscal year.

The motion passed on the following roll call vote:

**AYES:** Brooks, Campbell, Knight, Misetich and Mayor Duhovic  
**NOES:** None  
**ABSENT:** None

**Draft 2013 Rancho Palos Verdes/Rolling Hills Estates (RPV/RHE) All Hazards Multijurisdictional Mitigation Plan**

City Council Minutes  
December 3, 2013  
Page 9 of 11

City Clerk Morreale reported there were no requests to speak regarding this item.

Senior Administrative Analyst Bonano provided a brief staff report regarding this item. She noted that the 2013 Rancho Palos Verdes/Rolling Hills Estates (RPV/RHE) All Hazards Multijurisdictional Mitigation Plan would be placed on the City's website.

Discussion ensued among Council Members and staff.

Councilwoman Brooks moved, seconded by Mayor Pro Tem Knight, to approve the staff recommendation to: **ADOPT RESOLUTION NO. 2013-78, A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF RANCHO PALOS VERDES, ADOPTING THE 2013 ALL HAZARDS MULTIJURISDICTIONAL MITIGATION PLAN, AS PRESENTED.**

The motion passed on the following roll call vote:

**AYES:** Brooks, Campbell, Knight, Misetich and Mayor Duhovic  
**NOES:** None  
**ABSENT:** None

#### **Adoption of Revised Salary and Hourly Schedule for the Competitive, Management and Part-Time Positions**

City Clerk Morreale reported that Councilman Campbell requested this item be removed from the Consent Calendar for separate consideration, there were no requests to speak on the matter, and late correspondence was distributed prior to the meeting regarding this item.

Human Resources Manager Robinson provided a brief staff report regarding information he recently learned at a CalPERS consortium. He explained that every employee position in the City must be listed in the City's pay rate schedule, and noted this item has been presented to include the City Manager's pay rate into that schedule so that the pay rate schedule is in compliance with the California Government Code and CalPERS requirements.

Councilman Misetich moved, seconded by Mayor Pro Tem Knight, to: **ADOPT RESOLUTION NO. 2013-79, A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF RANCHO PALOS VERDES, REVISING THE SALARY AND HOURLY SCHEDULE FOR THE COMPETITIVE, MANAGEMENT AND PART-TIME POSITIONS, BY ADDING THE CITY MANAGER POSITION TO AFOREMENTIONED SCHEDULE, AND RESCINDING RESOLUTION NO. 2011-82.**

The motion passed on the following roll call vote:

**AYES:** Brooks, Campbell, Knight, Misetich and Mayor Duhovic

City Council Minutes  
December 3, 2013  
Page 10 of 11

**NOES:** None

**ABSENT:** None

**FUTURE AGENDA ITEMS:**

Mayor Pro Tem Knight commented on the recent receipt of a letter from the Water Replenishment District regarding a new Groundwater Reliability Improvement Program and the request for City support of the program.

Council directed staff to place this item on the Consent Calendar of a future agenda.

**CITY COUNCIL ORAL REPORTS:**

Each Council Member reported on his/her attendance at various organization and association meetings since the last City Council Oral Reports were provided on November 19, 2013.

**CLOSED SESSION REPORT:**

City Attorney Lynch reported that with respect to the existing litigation regarding the Nakamura, et al. (City of Rancho Palos Verdes) versus Southern California Edison case, the Council met in Closed Session to discuss this item and the Council voted (4-0), with Councilman Campbell absent, to authorize the City Attorney's Office to engage an expert to address issues that were raised.

**ADJOURNMENT:**

At 9:52 P.M., Mayor Duhovic adjourned the meeting.

/s/ Jerry V. Duhovic  
Mayor

## RHE City Council Minutes

### MINUTES

#### CITY COUNCIL MEETING

JANUARY 14, 2014

A meeting of the City Council of the City of Rolling Hills Estates was called to order at 5:40 p.m. in the City Council Chambers, 4045 Palos Verdes Drive North, by MAYOR MITCHELL.

City Council Members Present: Addleman, Huff, Mitchell, Zerunyan, Zuckerman

The CITY COUNCIL, with Planning Commission Chair Velveth Schmitz, then undertook interviews of candidates for vacancies on the Planning Commission.

After a brief recess following the interviews, MAYOR MITCHELL convened the regular meeting of the City Council of the City of Rolling Hills Estates that was called to order at 7:41 p.m. by MAYOR MITCHELL with MAYOR PRO TEM ADDLEMAN, COUNCILWOMAN HUFF, COUNCILMAN ZERUNYAN and COUNCILMAN ZUCKERMAN present.

#### ROLL CALL

City Council Members Present: Addleman, Huff, Mitchell, Zerunyan, Zuckerman

City Staff Present: City Manager Doug Prichard  
City Attorney Don Davis  
Assistant City Manager Greg Grammer  
Community Services Director Andy Clark  
Planning Director David Wahba  
Maintenance Leadman Mike Goldsmith

Others Present: Sheri Clewis, Park and Activities Commission  
Dale Allen, Park and Activities Commission  
Pam Schachter, Park and Activities Commission

#### 4. CEREMONIAL ITEMS

NONE

#### 5. ROUTINE MATTERS

##### A. CITY COUNCIL MINUTES OF DECEMBER 10, 2013

MAYOR PRO TEM ADDLEMAN moved, seconded by COUNCILMAN ZUCKERMAN

TO APPROVE THE CITY COUNCIL MINUTES OF DECEMBER 10, 2013 AS PRESENTED.

THERE BEING NO OBJECTION, MAYOR MITCHELL SO ORDERED.

##### B. DEMANDS AND WARRANTS – DECEMBER AND JANUARY

MAYOR PRO TEM ADDLEMAN moved, seconded by COUNCILMAN ZUCKERMAN

TO APPROVE WARRANTS 53200 THROUGH 53230 IN THE AMOUNT OF \$677,967.39; SUPPLEMENTAL WARRANTS 120113 THROUGH 120213; 122013; 52951 THROUGH 52971; 52972 (VOID); 52996 THROUGH 53072; 53071 (VOID) IN THE AMOUNT OF \$538,088.18 FOR A GRAND TOTAL AMOUNT OF \$1,115,393.10 WITH PROPER AUDIT.

AYES: Addleman, Huff, Mitchell, Zerunyan, Zuckerman

CITY COUNCIL MINUTES  
JANUARY 14, 2014

- 6. **CONSENT CALENDAR:** The following routine matters will be acted upon by one vote to approve with the majority consent of the City Council. There will be no separate discussion of these items unless good cause is shown by a member prior to the roll call vote. (Items removed will be considered under New Business.)

MAYOR PRO TEM ADDLEMAN moved, seconded by COUNCILMAN ZUCKERMAN

TO APPROVE ITEMS A-D.

- A. **READING OF ORDINANCES AND RESOLUTIONS**

Reading in full of all ordinances and resolutions presented for consideration to the City Council will be waived and all such ordinances and resolutions will be read by title only.

- B. **NOVEMBER 2013 SCHEDULE OF INVESTMENTS**

RECEIVED AND FILED.

- C. **NOVEMBER MONTHLY REVENUE AND EXPENDITURE REPORT**

RECEIVED AND FILED.

- D. **AUTHORITY TO DESTROY OBSOLETE RECORDS**

GRANTED AUTHORITY TO MICRO-IMAGE AND DESTROY THE OBSOLETE RECORDS.

THERE BEING NO OBJECTION, MAYOR MITCHELL SO ORDERED.

- 7. **AUDIENCE ITEMS NOT ON THE AGENDA/WRITTEN AND ORAL COMMUNICATIONS**

NONE

- 8. **PUBLIC HEARINGS/MEETINGS**

NONE

- 9. **NEW BUSINESS**

- A. **PARK AND ACTIVITIES COMMISSION MINUTES OF JANUARY 7, 2014**

COUNCILMAN ZERUNYAN moved, seconded by MAYOR PRO TEM ADDLEMAN

TO RECEIVE AND FILE THE PARK AND ACTIVITIES COMMISSION MINUTES OF JANUARY 7, 2014.

THERE BEING NO OBJECTION, MAYOR MITCHELL SO ORDERED.

- 1. **ACTION ITEM FROM EQUESTRIAN COMMITTEE MEETING OF JUNE 24, 2013 AND PARK AND ACTIVITIES COMMISSION MEETING OF JANUARY 7, 2014 - PROPOSED IMPROVEMENTS TO HOWLETT PARK EQUESTRIAN CENTER ARENA #2**

**Recommendation:** That the City Council accept the Park and Activities Commission's recommendations as follows: 1) That no change in footing in Arenas 1 and 2 be considered; 2) Allow time for the arenas to receive increased maintenance utilizing the new sprinkler system and not consider base improvements until adequate time has passed to see if any problems arise with the base; and 3) Consider continuing the schedule under the Ernie Howlett Park Master Plan which lists the judges booth and perimeter park pathway as the next improvements to be completed.

Community Services Director Clark provided a staff report (as per agenda material).

In response to COUNCILMAN ZUCKERMAN, City Manager Prichard clarified that it was the Portuguese Bend Horseshow's original desire to have the GGT footing installed instead of sand in both arenas.

Betsy Schoettlin stated that her understanding of the main reason for installation of the GGT footing was to decrease the number of days the rings would be closed due to rain. She believed that the majority of equestrians in the area are recreational riders and installing GGT footing has greatly increased accessibility. She commended Maintenance Leadman Goldsmith for his work on maintaining the rings. She stated that changing the footing now to accommodate out of area riders does not make sense and that converting the footing back to sand would be a waste of money.

Becky Martin commented that the PCHS authorizes English and Western shows on the West Coast, including the Portuguese Bend Horseshow. In regards to the footing at Howlett Park, she stated that GGT is not suitable for reining or other speed events. She then provided an extensive history of how this issue came to the COUNCIL. Additionally, she stated that she believed the amount of maintenance required by the GGT footing was excessive. She asked the COUNCIL to support changing the footing back to sand.

Christine Wolf noted that she is a new resident who wanted to live in an equestrian community. She noted that they are primarily recreational riders, but have participated in horseshows. She noted that the GGT footing is not appropriate for Western events. She then stated that she attended the Park and Activities Commission meeting where this item was discussed and suggested having one arena with GGT footing for jumping and the other ring with sand footing for Western riding to better serve both disciplines.

Patricia Harik commented that she also attended the Park and Activities Commission and Equestrian Committee meetings. She noted her opinion that the change to sand footing should be done sooner rather than later. She noted that GGT has many benefits, but has received complaints from Western riders about this type of footing. She acknowledged that GGT is all weather, but is costly to maintain. She asked the COUNCIL to reconsider replacing the footing.

Pam Schachter, Park and Activities Commissioner, clarified that the Portuguese Bend Horseshow representatives were at the Park and Activities Commission and did not speak, but contacted her after the meeting. She noted that the Portuguese Bend Horseshow would continue to take place at Howlett Park, but that the medal finals might have been moved because of the quality of the previous sand footing. She suggested not replacing the base because it is still in good shape. She noted the Park and Activities Commission wanted to take a wait and see approach with the new watering system. She noted that she is not against the sand arena, but major work would be needed to accommodate the reiners which does not serve the local equestrians. She then discussed the alternatives that were considered by the joint sub-committee of the Park and Activities Commission and Equestrian Committee.

In response to MAYOR MITCHELL, Maintenance Leadman Goldsmith noted that currently there are no issues with the base and explained that maintenance typically takes place approximately five times a week. He also commented on the new watering system.

In response to COUNCILMAN ZERUNYAN, Maintenance Leadman Goldsmith responded that once a week maintenance is usually sufficient for a sand ring whereas GGT requires maintenance three to five times a week.

In response to COUNCILMAN ZERUNYAN, Maintenance Leadman Goldsmith noted that sand breaks down faster and would have to be replaced more often than GGT.

In response to COUNCILMAN ZERUNYAN, Maintenance Leadman Goldsmith stated that he has not observed any safety problems with GGT.

Discussion continued with Maintenance Leadman Goldsmith stating that a rock dust base is preferable, but as of now there is no problem. He explained the difference between sand and GGT stating that the latter will soak up water like a sponge, but sand will have pockets where water will settle due to the underlying non-compacted fill at the park.

City Manager Prichard noted that staff has been wrestling with these issues and there is not any clear cut answer to these questions because of individual discipline preferences. He noted that staff is attempting to come up with a reasonable solution that will benefit the greatest number of equestrians using the facility. Because of the differing testimony received, the Park and Activities Commission wanted to wait on this project in order to gain some experience and make a cost-effective decision.

Dale Allen, Park and Activities Commission, commented that the COUNCIL should make these facilities available for everyone. He stated that riders who have high performance horses will not go into those rings because they cannot make sharp turns and slide. He commented that the Equestrian Committee voted unanimously to have sand installed which would require less maintenance.

In response to MAYOR MITCHELL regarding Western riders, Commissioner Allen noted that there are other rings in the City that can accommodate this discipline.

COUNCILMAN ZUCKERMAN inquired about storage of the GGT footing if it were to be replaced. Commissioner Allen stated that there is plenty of room for storage at the park. Maintenance Leadman Goldsmith concurred.

Maintenance Leadman Goldsmith explained that crowning in the rings allows for rain to drain outside the riding area, but the new train of thought is to slope it one way to prevent puddles.

In response to City Manager Prichard regarding options for turnouts that are available, Maintenance Leadman Goldsmith noted that there are three, but the lower ring is not used regularly. Additionally, he noted that when there is rain, the ring with sand would be closed, but the ring with GGT footing would not.

City Manager Prichard inquired as to what the estimate would be to make the changes under consideration. Community Services Director Clark noted that the cost could be anywhere between \$45,000-55,000 to make all the improvements to the base, slope, footing and compaction.

MAYOR MITCHELL suggested allowing some time to go by before changing over the footing. She then questioned the COUNCIL if they want to accommodate all riding disciplines at Ernie Howlett Park.

COUNCILMAN ZERUNYAN noted that the City could best serve the interests of all equestrians by including as many footing options as possible for all disciplines.

COUNCILMAN ZERUNYAN moved, seconded by COUNCILWOMAN HUFF

TO DIRECT STAFF TO: 1) BRING BACK A REQUEST FOR PROPOSALS (RFP) AT THE NEXT MEETING FOR IMPROVEMENTS TO ARENA 2 AT HOWLETT PARK TO INCLUDE INSTALLATION OF SAND FOOTING; 2) PROVIDE FUNDING SOLUTIONS FOR THE IMPROVEMENTS; AND 3) OBTAIN FEEDBACK FROM REPRESENTATIVES OF THE PORTUGUESE BEND HORSESHOW.

THERE BEING NO OBJECTION, MAYOR MITCHELL SO ORDERED.

ADJOURNED TO PEPPER TREE FOUNDATION BOARD OF DIRECTORS AT 9:18 P.M.

**B. REGULAR ANNUAL BOARD OF DIRECTORS MEETING**

Recommendation: That the Pepper Tree Foundation Board of Directors: 1) Conduct any necessary Foundation business; and 2) To receive and file the staff report.

Community Services Director Clark provided a staff report (as per agenda material).

MAYOR PRO TEM ADDLEMAN moved, seconded by MAYOR MITCHELL

TO RECEIVE AND FILE THE STAFF REPORT.

THERE BEING NO OBJECTION, MAYOR MITCHELL SO ORDERED.

COUNCILMAN ZERUNYAN encouraged the public to make a tax-deductible donation to the Pepper Tree Foundation to preserve the quality of the parks in the City.

RECONVENED TO CITY COUNCIL MEETING AT 9:25 P.M.

**C. DRAFT 2013 RANCHO PALOS VERDES/ROLLING HILLS ESTATES MULTIJURISDICTIONAL HAZARD MITIGATION PLAN**

Recommendation: That the City Council approve Resolution No. 2315 adopting the updated 2013 Rancho Palos Verdes/Rolling Hills Estates Multijurisdictional Hazard Mitigation Plan.

Assistant City Manager Grammer provided a staff report (as per agenda material).

COUNCILMAN ZUCKERMAN inquired if any comments were received regarding this plan. Assistant City Manager Grammer noted that Planning Commissioner Carl Southwell provided some observations which will be included in the final document.

COUNCILMAN ZERUNYAN inquired if this document includes equestrian concerns should a disaster strike. Assistant City Manager Grammer responded that the Continuity of Operations Plan addresses those concerns.

**1. RESOLUTION NO. 2315 FOR ADOPTION**

A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF ROLLING HILLS ESTATES ADOPTING THE 2013 MULTIJURISDICTIONAL HAZARD MITIGATION PLAN

MAYOR PRO TEM ADDLEMAN moved, seconded by COUNCILMAN ZERUNYAN

TO ADOPT RESOLUTION NO. 2315.

AYES: Addleman, Huff, Mitchell, Zerunyan, Zuckerman

City Manager Prichard read Resolution No. 2315 by title only.

10. OLD BUSINESS

NONE

11. CITY ATTORNEY ITEMS

NONE

12. CITY COUNCIL/REGIONAL COMMITTEE REPORTS: This item provides the opportunity for Members of the City Council to provide information and reports to other Members of the City Council and/or the public on any issues or activities of currently active Council Committees, ad hoc committees, regional or state-wide governmental associations, special districts and/or joint powers authorities and their various committees on which Members of the City Council might serve or have an interest, which are not otherwise agendaized.

- A. MAYOR MITCHELL announced that the South Bay Cities Council of Governments General Assembly is scheduled for Friday, February 28. She encouraged everyone to attend. Additionally, she noted that the SBCCOG held a Strategic Plan Workshop recently.
- B. MAYOR MITCHELL reported that she attended a meeting at Southern California Association of Governments (SCAG) where discussion took place regarding the 2016 Regional Transportation Plan.
- C. MAYOR MITCHELL reported that one of the items discussed at the California Air Resources Board was sustainable freight transport.
- D. MAYOR PRO TEM ADDLEMAN reported on the SCAG Transportation Program and Metro's bike lanes.
- E. COUNCILMAN ZERUNYAN reported that the SCAG Community, Economic and Human Development Committee discussed economic development demographics and believed this would be useful for the City.
- F. COUNCILMAN ZUCKERMAN was pleased to report that the West Nile Virus season is over, but encouraged everyone to be cautious. He reported that the City of Los Angeles is providing abatement funding for Machado Lake.

13. MAYOR AND COUNCIL ITEMS: This item provides the opportunity for Members of the City Council to request information on currently pending projects and/or issues of public concern, direct that an item be agendaized for future consideration and/or make announcements of interest to the public.

A. MAYOR MITCHELL

1. APPOINTMENT OF PLANNING COMMISSION MEMBERS

MAYOR MITCHELL reported that the COUNCIL and Planning Commission Chair Velveth Schmitz interviewed applicants prior to the meeting. She noted that she was impressed with the caliber of residents who applied for these positions.

After further discussion, MAYOR PRO TEM ADDLEMAN moved, seconded by COUNCILMAN ZERUNYAN

TO APPOINT ROBERT MEDAWAR, ROBERT SCHACHTER, AND VICTOR YOO TO THE PLANNING COMMISSION.

THERE BEING NO OBJECTION, MAYOR MITCHELL SO ORDERED.

City Manager Prichard noted that, with Mr. Medawar's appointment, staff will now recruit for a Park and Activities Commission vacancy.

2. COMMITTEE ASSIGNMENTS

After some discussion, MAYOR PRO TEM ADDLEMAN moved, seconded by COUNCILMAN ZUCKERMAN

TO: 1) APPROVE THE COMMITTEE ASSIGNMENTS AS AMENDED;  
2) APPOINT TIM THOMAS AS THE CHAIR AND SHERI LEWIS AS THE VICE CHAIR OF THE PARK AND ACTIVITIES COMMISSION;  
AND 3) APPOINT MIKE CONWAY AS THE CHAIR AND TIM SCOTT AS THE VICE CHAIR OF THE PLANNING COMMISSION.

THERE BEING NO OBJECTION, MAYOR MITCHELL SO ORDERED.

MAYOR MITCHELL noted that all committee members have been reappointed for one year and those Commissioners whose terms were set to expire have been reappointed and will meet with the COUNCIL at a later date to review Commission issues.

- B. MAYOR PRO TEM ADDLEMAN noted that he and COUNCILWOMAN HUFF will attend the Chamber of Commerce Annual Economic Forecast Breakfast on Friday, January 17.
- C. Planning Director Wahba provided an update on the Cal Water PV Pipeline Project.

14. CLOSED SESSION

NONE

15. ADJOURNMENT

At 10:18 p.m. MAYOR MITCHELL formally adjourned the meeting.

## RHE Website Screen Shot

The screenshot shows a web browser window displaying the City of Rolling Hills Estates website. The browser's address bar shows the URL: <http://ci.rolling-hills-estates.ca.us/index.aspx?page=23&recordid=276&returnURL=%2findex.aspx%3f>. The website's navigation menu includes Home, About Us, What's New (highlighted), I want to..., Living, Equestrian, and Your Government. A sidebar on the left lists various services such as Calendar, Employment Opportunities, Living With Coyotes, Project Updates, City Newsletter, Agendas & Minutes, Current "Requests for Proposals" and/or "Requests for Qualifications", Large Vehicle Parking Ordinance No. 681, View Preservation Ordinance No. 661, Changes to "H" District Ordinance No. 682, Palos Verdes Drive North Bike Lane Project, and Community News & Updates (highlighted).

The main content area is titled "What's New" and "COMMUNITY NEWS & UPDATES". It features a sub-header "Draft Hazard Mitigation Plan 2013" with a "Posted Date: 12/20/2013". Below this, the text reads: "City staff has recently completed a Draft Multijurisdictional Hazard Mitigation Plan (Plan) and is now circulating it for public comment. The Plan was prepared in response to the Disaster Mitigation Act of 2000 (DMA 2000) and is an update to the 2004 Joint Natural Hazards Mitigation Plan prepared cooperatively with the City of Rancho Palos Verdes. The 2013 Plan satisfies both RHE's and RPV's mitigation planning requirements by identifying hazards, potential losses, mitigation needs, goals, and strategies. The action items address multi-hazard issues, as well as activities for earthquake, wildfire, earth movement (landslide and debris flow), tsunami, and technological and human-caused hazards. This type of planning supplements each city's comprehensive emergency management programs."

The article continues: "The Draft Plan is available for review and comment. [Click here for a copy of the Plan.](#) A hard copy is also available at the front counter at RHE City Hall."

It then states: "The Plan will be presented for review and approval at the City Council meeting on January 14, 2014 at 7:00 pm. The adopted Plan must be submitted to the Federal Emergency Management Agency (FEMA) by January 28, 2014."

Finally, it provides contact information: "Please submit your comments or questions to: Greg Grammer, Assistant City Manager, at [gregg@ci.rolling-hills-estates.ca.us](mailto:gregg@ci.rolling-hills-estates.ca.us) or Niki Wetzel, Principal Planner, at [nikiw@ci.rolling-hills-estates.ca.us](mailto:nikiw@ci.rolling-hills-estates.ca.us)."

## RPV Emergency Preparedness Committee Minutes

### MINUTES EMERGENCY PREPAREDNESS COMMITTEE REGULAR MEETING NOVEMBER 21, 2013

The meeting was called to order at 7:00 p.m. by Chair Weiner in the Community Room at City Hall, 30940 Hawthorne Boulevard.

PRESENT: Chair Weiner, Vice-Chair Foster, Member Feinberg, Member Harter and Member Boudreau

Staff present: Senior Analyst/Emergency Services Coordinator Tracy Bonano and Recording Secretary Teresa Takaoka

#### APPROVAL OF THE AGENDA:

Member Boudreau moved, seconded by Member Harter to approve the Agenda. Motion passed, (4-0).

#### NEW BUSINESS:

##### Minutes of September 19, 2013

Chair Weiner moved, seconded by Vice-Chair Foster, that the September 19, 2013 minutes be approved, as amended. Motion passed, (4-0).

##### EPC Web Page Update

Senior Analyst Bonano noted that she had reviewed all the modifications to the webpage and that PVNet would be submitting the files to the Chinese and Spanish interpreters shortly. Chair Weiner inquired as to the timeline the translations would be completed. Senior Analyst Bonano opined that she thought they could be ready in a few weeks. Chair Weiner expressed when the site is live he could ask the Daily Breeze to run an article highlighting the website. He would also like Senior Analyst Bonano to feature it in a Breaking News listserv alert as well as Channel 33. Senior Analyst Bonano agreed.

Member Feinberg moved, seconded by Member Harter to receive and file the web page update. Motion passed, (4-0).

##### Salvation Army Crestmont MOU Update

Senior Analyst Bonano shared that she had received revisions to the Memorandum of Understanding (MOU) with the Salvation Army from the City Attorney in time for the meeting and distributed copies. Chair Weiner expressed his appreciation to Major Toy

for the Salvation Army's willingness to work with the City. He inquired as to whether Major Toy knew how long it would take the Salvation Army to review the MOU and respond to the City. Major Toy stated that the legal department would review the documents but he could not provide a definitive timeline.

Chair Weiner moved, seconded by Member Boudreau to accept the Memorandum of Understanding as amended. Motion passed, (4-0).

#### San Pedro Hill Repeater Update

Member Feinberg provided an update regarding the San Pedro Hill repeater noting that the City will need an officially sanctioned frequency. The City is currently using the same frequency that is authorized to be used only by Mr. David Corsiglia. Member Feinberg noted that testing was done during the RAT Beach 62 Mile bike tour and the radios worked well, with only a few areas that had dead zones, mainly due to the terrain or hillsides they were near. Chair Weiner asked if Member Feinberg could estimate the total coverage the hill now has. Member Feinberg felt that save for the dead zones near Hesse Park; Montemalaga (near the Unitarian Church); Fire Station 83; and, Palos Verdes Drive East (westbound), the City has about 95% coverage. Member Feinberg expressed her desire to have a City staff person take the lead in getting the dedicated radio frequency and necessary licensing and also ensuring that the back ordered shelving and fans are received in a timely manner. Senior Analyst Bonano offered to assist with the items raised by Member Feinberg. Chair Weiner opined that the City of Rancho Palos Verdes is a model for how other cities could use ham radios in their emergency preparedness programs.

Chair Weiner moved, seconded by Vice Chair Foster to receive and file the San Pedro Repeater update. Motion passed, (4-0).

#### Discuss Review of the 2013 RPV/RHE All Hazards Multijurisdictional Mitigation Plan (Plan)

Senior Analyst Bonano provided a brief presentation to the committee members. Member Feinberg inquired as to why terrorism did not appear as a threat in the new Plan when it was initially cited in the 2004 Plan. Yet, upon further review, Member Feinberg discovered it was not included in the 2004 Plan. Senior Analyst Bonano stated she would research this with the consultant as it was her understanding, as well as Chair Weiner's recall, that terrorism was cited in the 2004 Plan. Member Feinberg also inquired as to why the Beauty and the Beast presentation devotes a section to terrorism, when perhaps the validity for citing wildfires/severe weather would have a greater impact in the presentation.

Member Harter opined that perhaps the threat of terrorism is considered in a much broader spectrum to include facilities near the Palos Verdes Peninsula, like the Port of Los Angeles; water reservoirs; and incidents like bomb threats at the LAX airport; and,

EMERGENCY PREPAREDNESS COMMITTEE MINUTES  
November 21, 2013  
Page 2 of 4

school shootings. Chair Weiner concurred with Member Feinberg and suggested updating the Beauty and the Beast presentation minus the terrorism element. Senior Analyst Bonano felt a new Beauty and the Beast document created without the terrorism reference could be used for future presentations.

In regards to the updated Plan, Member Boudreau suggested switching the order of the logos that appear on the top of the pages of the plan so that Rancho Palos Verdes' logo appears first. Member Boudreau also inquired as to what the City's responsibility would be if a homeowner built in what is noted as the "danger severe slope" area; and/or the landslide area. Chair Weiner and Senior Analyst Bonano concurred that if a homeowner built in that area, it would be unlikely that FEMA would withhold City funds as it would be a matter between the homeowner and their insurance company. Member Boudreau inquired as to how many meetings were held prior to completing the plan. Senior Analyst Bonano stated they had met five times and that bi-annual meetings will be held with more regularity once FEMA approves the plan. It is her understanding that FEMA will take some time reviewing the document.

Member Boudreau moved, seconded by Vice-Chair Foster to present the Draft 2013 All Hazards Multijurisdictional Mitigation Plan (Plan) to City Council for approval as presented. Motion passed, (4-0).

#### **COMMUNICATIONS:**

#### **STAFF:**

Senior Analyst Bonano inquired as to whether the committee members had any objection to cancelling the December meeting as there would be no items on the agenda except for the minutes of tonight's meeting and Senior Analyst Bonano would not be present. The decision to cancel December's meeting was reached unanimously.

#### **COMMITTEE:**

Member Feinberg shared that she had manned an emergency preparedness booth at a local elementary school but the event had not been well attended. She noted that a presenter used a collapsible trade show display which she felt would be beneficial to acquire for the committee's use. Senior Analyst Bonano said she would look into securing one. Member Feinberg also suggested assembling the Beauty and the Beast version 2 presentation. Chair Weiner offered to be the point person collecting slides.

Member Boudreau inquired about the Public Service Announcements (PSA's) that used to run on Channel 33 which spoke to landslide issues; the need for residents to not let the hillside be overgrown; and, discouraged excessive planting of vegetation. Senior Analyst Bonano stated she would inquire with Channel 33 staff.

EMERGENCY PREPAREDNESS COMMITTEE MINUTES

November 21, 2013

Page 3 of 4

Member Weiner commented that recently he was given direct contact information for a Cal Water representative and hopes to move forward in getting the Peninsula cities together with other utility representatives. He would like to have a joint City Council and Emergency Preparedness Committee meeting in the near future to discuss the utility companies long term disaster planning.

**PUBLIC COMMENTS:**

None.

**ADJOURNMENT:**

Chair Weiner adjourned the meeting at 8:26 p.m.

**Approved by: Tracy Bonano – Senior Analyst & Emergency Services Coordinator**

## Section 11: Plan Maintenance

---

The Plan Maintenance section of this document details the formal process that will ensure that the Plan remains an active and relevant document. The plan maintenance process includes a schedule for monitoring and evaluating the Plan semi-annually and producing a plan update every five years. This section describes how the Cities will integrate public participation throughout the plan maintenance process.

### Monitoring and Implementing the Plan

#### *Plan Adoption*

Adoption of the Plan by the Cities' governing bodies was one of the prime requirements for approval of the original Plan. Once the Plan is completed and FEMA approval granted, the City Councils will be responsible for adopting the Plan. The governing body has the responsibility and authority to promote sound public policy regarding hazards. The local agency governing body will have the authority to periodically update the plan as it is revised to meet changes in the hazard risks and exposures in the Cities. The approved Plan will be significant in the future growth and development of the planning area.

Future amendments and updates will be the responsibility of the City Managers.

#### *Convener*

The City Managers will delegate the Hazard Mitigation Subcommittee Chairs as Conveners to facilitate the Subcommittee meetings, and will assign tasks such as updating and presenting the Plan to the City Managers. Plan implementation and evaluation will be a shared responsibility among all Subcommittee members. The City Managers will have authority to approve amendments and updates to the Plan but will need to agree with the other city on those changes. In the future, should either City decide to publish a Plan separately, that will be acceptable.

#### *Hazard Mitigation Planning Subcommittees*

The Hazard Mitigation Planning Subcommittees will be responsible for coordinating implementation of plan action items and undertaking the formal review process. The convener will assign representatives from City departments, divisions, and agencies, including, but not limited to, the current Subcommittee.

In order to make the Subcommittee as broad and useful as possible, the City Managers may choose to involve other relevant organizations and agencies in hazard mitigation. These additional appointments could include:

- ✓ A representative from the American Red Cross
- ✓ A representative from a county government emergency response agency
- ✓ A representative of Utilities and other Special Districts providing infrastructure services to the Cities

The Subcommittee will meet no less than semi-annually. Meeting dates will be scheduled once the final Subcommittee has been established. These meetings will provide an opportunity to discuss the progress of the action items and maintain the partnerships that are essential for the sustainability of the Plan.

*Implementation through Existing Programs\*†*

The Cities addresses statewide planning goals and legislative requirements through their General Plans, Capital Improvement Plans (CIP), and City Building and Safety Codes. The Plan provides a series of recommendations - many of which are closely related to the goals and objectives of existing planning programs. The Cities will have the opportunity to implement recommended mitigation action items through existing programs and procedures.

General Plan Policies related to hazard mitigation have been included in this Plan update.

Both Cities Building and Safety Department is responsible for adhering to the State of California’s Building and Safety Codes. In addition, the Hazard Mitigation Planning Subcommittees will work with other agencies at the state level to review, develop and ensure Building and Safety Codes are adequate to mitigate or present damage by hazards. This is to ensure that life-safety criteria are met for new construction.

Some of the goals and action items in the Plan may be achieved through activities recommended in the CIP. Various City departments develop the CIP and review it on an annual basis. Upon annual review of the CIP, the Planning Team will work with the City departments to identify areas that the Plan action items are consistent with CIP goals and integrate them where appropriate.

Within six months of formal adoption of the Plan, the recommendations listed above will be incorporated into the process of existing planning mechanisms at the City level. The meetings of the Subcommittees will provide an opportunity for members to report back on the progress made on the integration of mitigation planning elements into City planning documents and procedures.

### *Economic Analysis of Mitigation Projects*

FEMA's approach to identify the costs and benefits associated with hazard mitigation strategies, measures, or projects fall into two general categories: benefit/cost analysis and cost-effectiveness analysis.

Conducting benefit/cost analysis for a mitigation activity can assist communities in determining whether a project is worth undertaking now, in order to avoid disaster-related damages later.

Cost-effectiveness analysis evaluates how best to spend a given amount of money to achieve a specific goal. Determining the economic feasibility of mitigating hazards can provide decision-makers with an understanding of the potential benefits and costs of an activity, as well as a basis upon which to compare alternative projects.

Given federal funding, the Planning Team will use a FEMA-approved benefit/cost analysis approach to identify and prioritize mitigation action items. For other projects and funding sources, the Planning Team will use other approaches to understand the costs and benefits of each action item and develop a prioritized list. For more information regarding economic analysis of mitigation action items, please see Appendix A: Benefit/Cost Analysis.

## Evaluating and Updating the Plan\*

### *Formal Review Process*

Both Cities will create a Hazard Mitigation Planning Subcommittee that will be responsible for evaluating, monitoring, implementing, and updating their portions of the Plan.

The Plan will be evaluated on a semi-annual basis to determine the effectiveness of programs, and to reflect changes in land development or programs that may affect mitigation priorities. The evaluation process includes a firm schedule and timeline, and identifies the agencies and organizations participating in plan evaluation. The Convener or designee will be responsible for contacting the Subcommittee members and organizing the meetings. Members will be responsible for monitoring and evaluating the progress of the mitigation strategies in the Plan.

The Subcommittee will review the goals and action items to determine their relevance to changing situations in the Cities, as well as changes in State or Federal policy, and to ensure they are addressing current and expected conditions. The Subcommittee will also review Section 3: Risk Assessment portion of the Plan to determine if this information should be updated or modified, given any new available data. The coordinating organizations responsible for the various action items will report on the status of their projects, the success of various implementation processes, difficulties encountered, success of coordination efforts, and which strategies should be revised.

The Convener will be responsible for including all of the Subcommittee members in implementing and updating the Plan. The members will meet at least twice to make appropriate changes to the Plan before submitting it to the City Manager. The Subcommittee will inform the

#### **\* ELEMENT A: PLANNING PROCESS | A6**

A6. Is there a description of the method and schedule for keeping the plan current (monitoring, evaluating and updating the mitigation plan within a 5-year cycle)? (Requirement §201.6(c)(4)(i))

other City of the changes made to the Plan. The Subcommittee Chairs will also notify all holders of the Plan when changes have been made. Every five years the updated plan will be submitted to the State Hazard Mitigation Officer at the California Office of Emergency Services for review and the Federal Emergency Management Agency for approval. The City Managers are authorized to adopt future updates and amendments to the Plan.

*Continued Public Involvement\**

The Cities are dedicated to involving the public directly in the continual review and updates to the Plan. Copies of the Plan will be catalogued and made available at City Hall and at all City operated public libraries. The existence and location of these copies will be publicized in City newsletters and on the City websites. The websites will also contain the Point of Contact information that appears in the Executive Summary of the Plan. The Points of Contact will be responsible for gathering and tracking comments and concerns. A public meeting will also be held after each evaluation or when deemed necessary by the Subcommittee. The meetings will provide the public a forum in which they can express their concerns, opinions, or ideas about the Plan.

The Public Information Officer will be responsible for using City resources to publicize the annual public meetings and maintain public involvement through the public access channel, web page, and newspapers as appropriate.

**\* ELEMENT A: PLANNING PROCESS | A5**  
A5. Is there discussion of how the community(ies) will continue public participation in the plan maintenance process? (Requirement §201.6(c)(4)(iii))

## PART IV: APPENDX

# Appendix A: Benefit/Cost Analysis

---

Benefit/cost analysis is a key mechanism used by the California Office of Emergency Services, the Federal Emergency Management Agency, and other state and federal agencies in evaluating hazard mitigation projects, and is required by the Robert T. Stafford Disaster Relief and Emergency Assistance Act, Public Law 93-288, as amended.

This appendix outlines several approaches for conducting economic analysis of hazard mitigation projects. It describes the importance of implementing mitigation activities, different approaches to economic analysis of mitigation strategies, and methods to calculate costs and benefits associated with mitigation strategies. Information in this section is derived in part from: 1) The Interagency Hazards Mitigation Team, 2) State Mitigation Plan, 3) Federal Emergency Management Agency Publication 331, and 4) Report on Costs and Benefits of Hazard Mitigation.

This section is not intended to provide a comprehensive description of benefit/cost analysis, nor is it intended to provide the details of economic analysis methods that can be used to evaluate local projects. It is intended to: 1) raise benefit/cost analysis as an important issue, and 2) provide some background on how economic analysis can be used to evaluate mitigation projects.

## Why Evaluate Mitigation Strategies?

Mitigation activities reduce the cost of disasters by minimizing property damage, injuries, and the potential for loss of life, and by reducing emergency response costs, which would otherwise be incurred.

Evaluating hazard mitigation provides decision-makers with an understanding of the potential benefits and costs of an activity, as well as a basis upon which to compare alternative projects.

Evaluating hazard mitigation provides decision-makers with an understanding of the potential benefits and costs of an activity, as well as a basis upon which to compare alternative projects. Evaluating mitigation projects is a complex and difficult undertaking, which is influenced by many variables.

First, natural disasters affect all segments of the communities they strike, including individuals, businesses, and public services such as fire, police, utilities, and schools. Second, while some of the direct and indirect costs of disaster damages are measurable, some of the costs are non-financial and difficult to quantify in dollars. Third, many of the impacts of such events produce “ripple-effects” throughout the community, greatly increasing the disaster’s social and economic consequences.

While not easily accomplished, there is value, from a public policy perspective, in assessing the positive and negative impacts from mitigation activities, and obtaining an instructive benefit/cost comparison.

Otherwise, the decision to pursue or not pursue various mitigation options would not be based on an objective understanding of the net benefit or loss associated with these actions.

## What are Some Economic Analysis Approaches for Mitigation Strategies?

The approaches used to identify the costs and benefits associated with hazard mitigation strategies, measures, or projects fall into two general categories: benefit/cost analysis and cost-effectiveness analysis. The distinction between the two methods is the way in which the relative costs and benefits are measured. Additionally, there are varying approaches to assessing the value of mitigation for public sector and private sector activities.

### *Benefit/Cost Analysis*

Benefit/cost analysis is used in hazards mitigation to show if the benefits to life and property protected through mitigation efforts exceed the cost of the mitigation activity. Conducting benefit/cost analysis for a mitigation activity can assist communities in determining whether a project is worth undertaking now, in order to avoid disaster related damages later. Benefit/cost analysis is based on calculating the frequency and severity of a hazard, avoided future damages, and risk.

In benefit/cost analysis, all costs and benefits are evaluated in terms of dollars, and a net benefit/cost ratio is computed to determine whether a project should be implemented (i.e., if net benefits exceed net costs, the project is worth pursuing). A project must have a benefit/cost ratio greater than 1 in order to be funded.

### *Cost-Effectiveness Analysis*

Cost-effectiveness analysis evaluates how best to spend a given amount of money to achieve a specific goal. This type of analysis, however, does not necessarily measure costs and benefits in terms of dollars. Determining the economic feasibility of mitigating hazards can also be organized according to the perspective of those with an economic interest in the outcome. Hence, economic analysis approaches are covered for both public and private sectors as follows.

### *Investing in Public Sector Mitigation Activities*

Evaluating mitigation strategies in the public sector is complicated because it involves estimating all of the economic benefits and costs regardless of who realizes them, and potentially to a large number of people and economic entities. Some benefits cannot be evaluated monetarily, but still affect the public in profound ways. Economists have developed methods to evaluate the economic feasibility of public decisions that involve a diverse set of beneficiaries and non-market benefits.

### *Investing in Private Sector Mitigation Activities*

Private sector mitigation projects may occur on the basis of one of two approaches: it may be mandated by a regulation or standard, or it may be economically justified on its own merits. A building or landowner, whether a private entity or a public agency, required to conform to a mandated standard may consider the following options:

1. Request cost sharing from public agencies
2. Dispose of the building or land either by sale or demolition
3. Change the designated use of the building or land and change the hazard mitigation compliance requirement
4. Evaluate the most feasible alternatives and initiate the most cost effective hazard mitigation alternative

The sale of a building or land triggers another set of concerns. For example, real estate disclosure laws can be developed which require sellers of real property to disclose known defects and deficiencies in the property, including earthquake weaknesses and hazards to prospective purchasers. Correcting deficiencies is expensive and time consuming, but their existence can prevent the sale of the building. Conditions of a sale regarding the deficiencies and the price of the building can be negotiated between a buyer and seller.

## How Can an Economic Analysis be Conducted?

Benefit/cost analysis and cost-effectiveness analysis are important tools in evaluating whether or not to implement a mitigation activity. A framework for evaluating alternative mitigation activities is outlined below:

*1. Identify the Alternatives:* Alternatives for reducing risk from hazards includes structural projects to enhance disaster resistance, education and outreach, and acquisition or demolition of exposed properties, among others. Different mitigation project assists in minimizing risk to hazards, but do so at varying economic costs.

*2. Calculate the Costs and Benefits:* Choosing economic criteria is essential to systematically calculating costs and benefits of mitigation projects and selecting the most appropriate alternative. Potential economic criteria to evaluate alternatives include:

- ✓ **Determine the project cost.** This may include initial project development costs, and repair and operating costs of maintaining projects over time.
- ✓ **Estimate the benefits.** Projecting the benefits or cash flow resulting from a project can be difficult. Expected future returns from the mitigation effort depend on the correct specification of the risk and the effectiveness of the project, which may not be well known. Expected future costs depend on the physical durability and potential economic obsolescence of the investment. This is difficult to project. These considerations will also provide guidance in selecting an appropriate salvage value. Future tax structures and rates must be projected. Financing alternatives must be researched, and they may include retained earnings, bond and stock issues, and commercial loans.
- ✓ **Consider costs and benefits to society and the environment.** These are not easily measured, but are assessed through a variety of economic tools including existence value or contingent value theories. These theories provide quantitative data on the value people attribute to physical or social environments. Even without hard data, however, impact of structural projects to the physical environment or to society should be considered when implementing mitigation projects.

- ✓ **Determine the correct discount rate.** Determination of the discount rate can just be the risk-free cost of capital, but it may include the decision maker's time preference and also a risk premium. Including inflation should also be considered.

*3. Analyze and Rank the Alternatives:* Once costs and benefits have been quantified, economic analysis tools can rank the alternatives. Two methods for determining the best alternative given varying costs and benefits include net present value and internal rate of return.

- ✓ **Net present value.** Net present value is the value of the expected future returns of an investment minus the value of expected future cost expressed in today's dollars. If the net present value is greater than the project costs, the project is determined feasible for implementation. Selecting the discount rate, and identifying the present and future costs and benefits of the project calculates the net present value of projects.
- ✓ **Internal Rate of Return.** Using the internal rate of return method to evaluate mitigation projects provides the interest rate equivalent to the dollar returns expected from the project. Once the rate has been calculated, it is compared to rates earned by investing in alternative projects. Projects may be feasible to implement when the internal rate of return is greater than the total costs of the project.

Once the mitigation projects are ranked on the basis of economic criteria, decision-makers can consider other factors, such as risk; project effectiveness; and economic, environmental, and social returns in choosing the appropriate project for implementation.

## How are Benefits of Mitigation Calculated?

### *Economic Returns of Hazard Mitigation*

The estimation of economic returns, which accrue to building or land owner as a result of hazard mitigation, is difficult. Owners evaluating the economic feasibility of mitigation should consider reductions in physical damages and financial losses. A partial list follows:

- ✓ Building damages avoided
- ✓ Content damages avoided
- ✓ Inventory damages avoided
- ✓ Rental income losses avoided
- ✓ Relocation and disruption expenses avoided
- ✓ Proprietor's income losses avoided

These parameters are estimated using observed prices, costs, and engineering data. The difficult part is to correctly determine the effectiveness of the hazard mitigation project and the resulting reduction in damages and losses. Equally as difficult is assessing the probability that an event will occur. The damages and losses should only include those that will be borne by the owner. The salvage value of the investment are important in determining economic feasibility. Salvage value becomes more important as the time horizon of the owner declines. This is important because most businesses depreciate assets over a period of time.

### *Additional Costs from Hazards*

Property owners should also assess changes in a broader set of factors that change as a result of a large natural disaster. These are usually termed “indirect” effects, but they have a very direct effect on the economic value of the owner’s building or land. They are positive or negative, and include changes in the following:

- ✓ Commodity and resource prices
- ✓ Availability of resource supplies
- ✓ Commodity and resource demand changes
- ✓ Building and land values
- ✓ Capital availability and interest rates
- ✓ Availability of labor
- ✓ Economic structure
- ✓ Infrastructure
- ✓ Regional exports and imports
- ✓ Local, state, and national regulations and policies
- ✓ Insurance availability and rates

Changes in the resources and industries listed above are more difficult to estimate and require models that are structured to estimate total economic impacts. Total economic impacts are the sum of direct and indirect economic impacts. Total economic impact models are usually not combined with economic feasibility models. Many models exist to estimate total economic impacts of changes in an economy. Decision makers should understand the total economic impacts of natural disasters in order to calculate the benefits of a mitigation activity. This suggests that understanding the local economy is an important first step in being able to understand the potential impacts of a disaster, and the benefits of mitigation activities.

## Additional Considerations

Conducting an economic analysis for potential mitigation activities can assist decision-makers in choosing the most appropriate strategy for their community to reduce risk and prevent loss from hazards. Economic analysis saves time and resources from being spent on inappropriate or unfeasible projects. Several resources and models are listed on the following page that assist in conducting an economic analysis for hazard mitigation activities.

Benefit/cost analysis is complicated, and the numbers may divert attention from other important issues. It is important to consider the qualitative factors of a project associated with mitigation that cannot be evaluated economically. There are alternative approaches to implementing mitigation projects. Many communities are looking towards developing multi-objective projects. With this in mind, opportunity rises to develop strategies that integrate hazard mitigation with projects related to watersheds, environmental planning, community economic development, and small business development, among others. Incorporating hazard mitigation with other community projects can increase the viability of project implementation.
