

Portuguese Bend Landslide

Portuguese Bend Landslide

Background

The City currently spends between \$600,000 to \$800,000 per year to maintain a safe, passable roadway through the Portuguese Bend Landslide Area. This constant repaving of Palos Verdes Drive South has been going on for approximately 40 years. It's estimated that this has cost the City approximately \$40M. The cause is reactivated landslides within the greater Ancient Altamira Landslide Complex, which encompasses over two of the City's roughly fourteen square miles, and moves at rates between hundredths of an inch per year and tens of feet per year. Regular travelers through the area are familiar with the frequent need to repair cracks and smooth out the roadway, and the disruption it brings to daily commutes. Furthermore, they present a challenge to City Public Works staff who are tasked with maintaining safe access through this area for the public, and especially in case of emergencies. Los Angeles County maintains above-grade, pressurized sanitary sewer lines which run through the landslide and are placed next to an arterial roadway. The pipes need constant inspection, monitoring and maintenance. These sewer lines are approximately 12 inches in diameter and are located along the roadway next to the ocean.

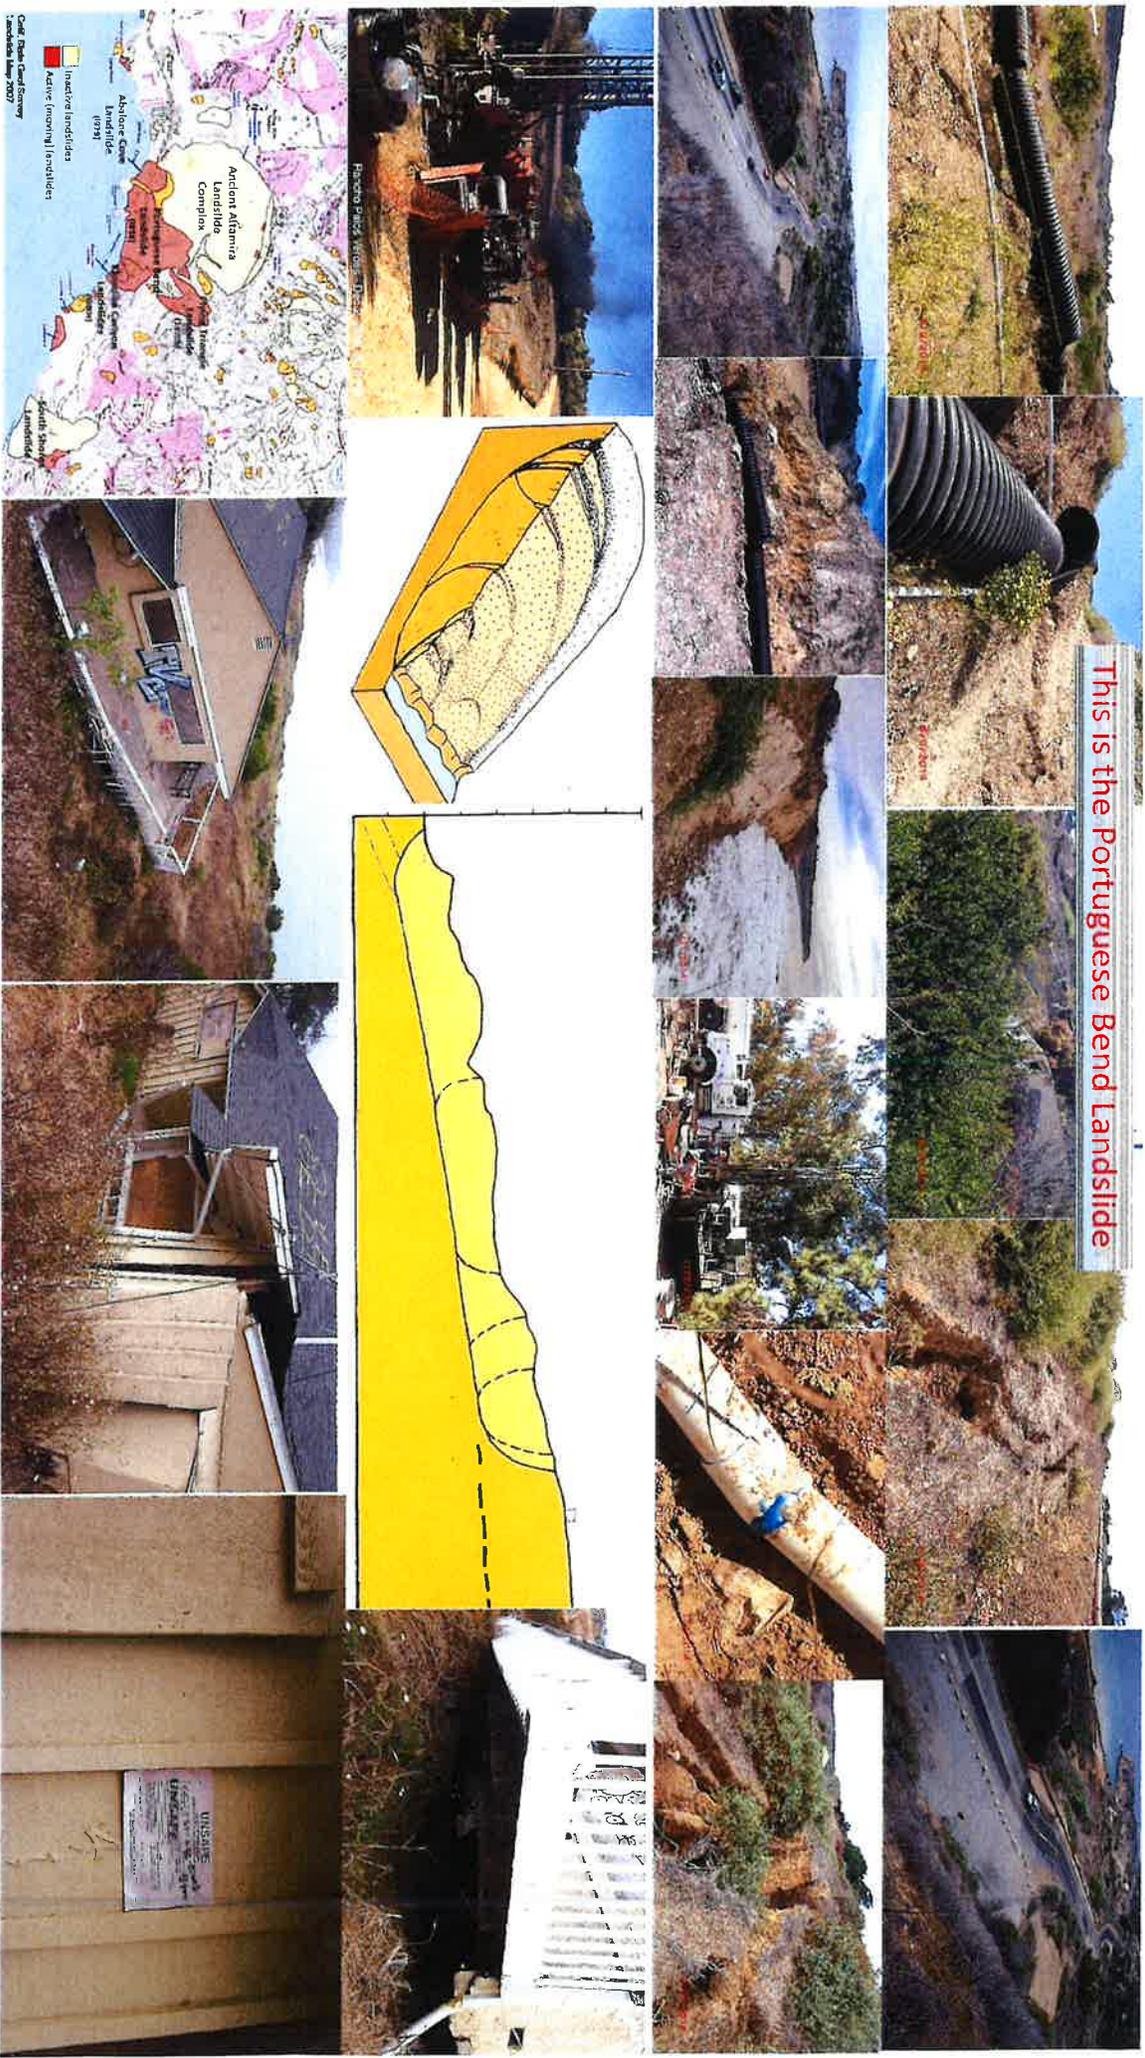

Solutions

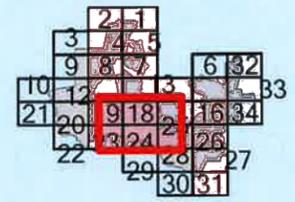

The City sought to develop a comprehensive program that would ultimately result in stabilizing the extensive landslide complex that exists in the Portuguese Bend area. The consultant, Daniel B. Stephens and Associates, examined the area firsthand, reviewed prior studies, and updated the existing feasibility study. A Final Feasibility Study was presented to the City Council and several remedies were approved by the City Council to be implemented: subsurface dewatering, storm water control, engineered slope stabilization measures, and eliminating septic system discharge into the landslide.

Specifically, the design for the lower portion of the landslide would convey the drainage runoff to the ocean directly; as well as include groundwater extraction horizontal drains (hydro-augers). The installation of hydro-augers will provide passive dewatering without the requirement of surface mounted equipment. Additionally, a hydrologic study and engineering analysis of the canyons will be performed to identify where, how, and to what extent the storm water infiltrates into the groundwater in the Portuguese Bend Landslide Complex.

Currently, the project is in the design phase and there will be a Public Outreach meeting on May 29, 2019. The City is also negotiating with the City of Rolling Hills to address and resolve the runoff as well as sanitary sewer effluent generated by septic tanks and private treatment systems within the City of Rolling Hills which contribute to landslide movement.

Survey Report

of the

Portuguese Bend Landslide 2018-2019 Monitoring Surveys

Dated: June 11, 2019, Revised July 9, 2019

for the

City of Rancho Palos Verdes

prepared by

McGee Surveying Consulting

The Portuguese Bend Landslide is monitored on a tri-annual basis beginning with the initial survey of all current monitoring points at the beginning of the rainy season in September-October of each year and two subsequent partial monitoring surveys of a subset of points in mid-winter and mid-spring. The initial survey is addressed in this Report and the partial surveys are addressed as Addendums at the end of this Report. The average date of each survey follows.

Initial Survey - October 10, 2018 Full Monitoring Survey - No. 22

Second Survey - January 29, 2019 Partial Monitoring Survey - No. 23

Third Survey - May 7, 2019 Partial Monitoring Survey - No. 24

Portuguese Bend Landslide Monitoring Survey
October 10, 2018 Initial Monitoring No. 22
for the
City of Rancho Palos Verdes
Prepared June 11, 2019, Revised July 9, 2019
by
McGee Surveying Consulting

PROJECT OVERVIEW:

McGee Surveying Consulting (MSC) performed a landslide monitoring survey in October 2018, January and May 2019 at Portuguese Bend on behalf of the City of Rancho Palos Verdes. The City of Rancho Palos Verdes assumed responsibility for monitoring the Portuguese Bend Landslide Complex circa 1994 from the County of Los Angeles. The surveys are planned, coordinated and executed by Michael McGee, PLS3945 of MSC who is responsible for the processing of the observations, network adjustments, analysis and reports.

The survey determined precise positions on an array of monitoring points to assess their periodic movements and overall movements since the date of establishment. The results of the initial September-October survey of 65 points are described in this Report and in the attached annual spreadsheet titled "PB MOVEMENT DATA POSTING 2007-2018.10 rev.xlsx". Two subsequent partial monitoring surveys of a sub-set of about 30 points are conducted in the following winter and spring. The results are reported here as addendums.

The Global Navigation Satellite System (GNSS) formerly referred to as GPS is used to measure positions of points because of its high accuracy and cost efficiency. The horizontal and vertical positions of the monitoring points are based on the North American Datum of 1983 (NAD83) and the North American Vertical Datum of 1988 (NAVD 88). The survey is referenced to physical monuments known as California CGPS (Continuous GPS) Stations in the region which are permanently mounted GPS and GNSS receivers tracking satellites 24 hours a day for monitoring seismic activity. The CGPS in California are comparable to the national CORS (Continuously Operated Reference Stations) Network.

The accuracy standard for these surveys follows. Points that move 5 centimeters (0.16 feet or 2 inches) or less per year are surveyed to meet an accuracy standard of one centimeter (0.033 feet) at the 95% Level of Confidence. Where the movements are greater, the accuracy standard is two centimeters (0.066 feet) at the 95% Level of Confidence. Field procedures are designed to accomplish this purpose and Quality Control-Quality Assurance (QAQC) processes discussed hereafter are incorporated to verify these accuracies are attained.

Prior to September 2007, successive coordinate differences were used by others to compute movements; however, arithmetic differences do not provide statistical information about the relative movement accuracies. Beginning with the initial survey by MSC in the 2007 survey, field and office procedures were designed to assure the accuracy and reliability of measurements and provide for queries between epochs that include statistical information and relative precisions of the reported movements. The temporal movements and statistical data are based on a rigorous simultaneous least-squares adjustment of multiple observations at two different epochs.

HISTORY

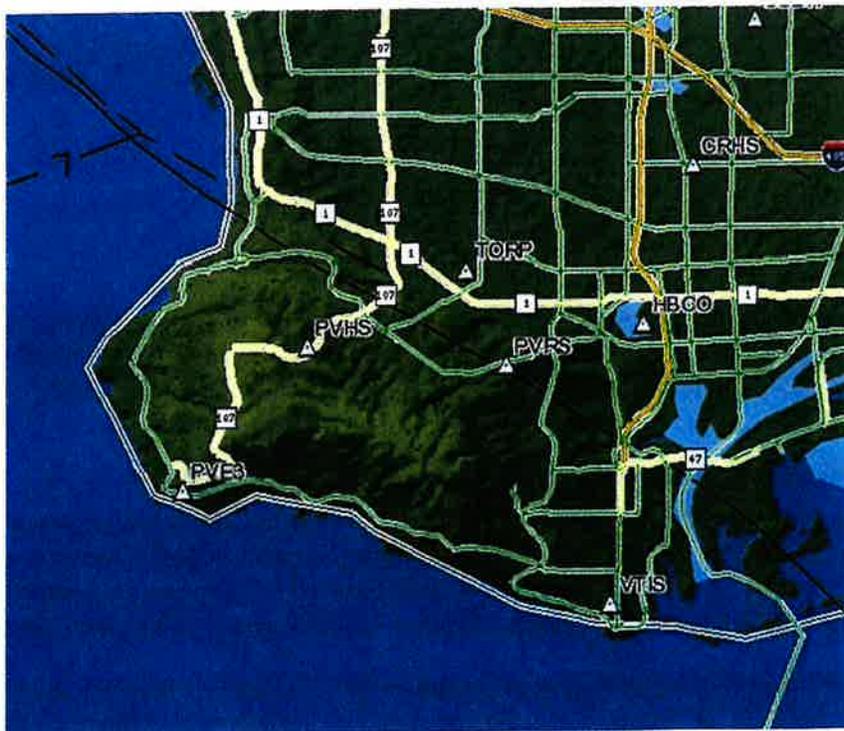

This monitoring survey is a continuation of a program initiated by the County of Los Angeles and taken over by the City of Rancho Palos Verdes circa 1994. McGee Surveying Consulting has conducted the field surveys and reporting since September 2007. The monitoring surveys have occurred annually since 2007, semi-annually since 2012 and three times a year beginning with the September 2014 survey. See the annual Survey Reports on file with the City Engineering Department commencing in 2007. The present status of monitored points is provided in the Appendix under "Monitoring Point Status". See the September 2007 Survey Report for a history of the previous survey process between 1994 and 2007. The historical 1994-2006 positions of all points are listed in the Charles Abbott Associates Inc. file "ALL POINTS MOST RECENT OBSERVED POSITION AS OF SEPTEMBER 15, 2006.xls". This file was attached as an electronic file to the 2007 Survey Report.

PROJECT DATUMS, REFERENCE SYSTEM

Horizontal Datum: The North American Datum of 1983 is the horizontal datum as established by the National Geodetic Survey (NGS) referred to as NAD83 (2007) Epoch 2007.00. The NAD83 (2007) Epoch 2007.00 Adjustment is one of a series of national adjustments of the NAD83 Datum since its adoption in 1986 and is the realization used for these monitoring surveys beginning in 2007. The positions of the CGPS Stations listed below were obtained in September 2007 from the California Spatial Reference Center (CSRC). The CSRC provides California Public Resources Code sanctioned positions for the CGPS Stations. The current national realization of NAD83 is the 2011 Adjustment published by the NGS and referred to as the NAD83 (2011) Epoch 2010.00 Adjustment. The CSRC published an updated adjustment of the CGPS stations in California known as the NAD83(2011) Epoch 2017.50 Adjustment. However, the above referenced NAD83 (2007) Epoch 2007.00 realization is retained by this survey to be consistent with prior reporting and the primary purpose of determining relative movements over time since the difference in epochs causes a 4.4 centimeter shift per year.

Reference Network: This survey is referenced to the CGPS Stations PVE3, PVHS, PVRS & VTIS shown and listed below. For more information see NGS Data Sheets for the PID's listed below and the CSRC website.

CGPS Stations (north up)

NAD83 (2007) Epoch 2007.00 - Units: Feet

CGPS	Latitude (dms)	Longitude (dms)	EH (feet)	NGS PID	NAME
PVE3	33 44 35.853290	-118 24 15.269036	235.42	None	PALOS VERDES CORS
PVHS	33 46 46.020150	-118 22 19.741258	853.99	AJ1915	PENINSULA HIGH SCH
PVRS *	33 46 25.891904	-118 19 14.067218	198.63	AJ1916	PALOS VERDES RES
VTIS	33 42 45.489584	-118 17 37.712290	197.52	AJ1936	MARINE EXCHANGE

* Falls in the proximity of a Fault Line as shown above but appears unaffected to date

Note: Some Stations are occasionally off-line during a monitoring campaign as stated in the reports.

Vertical Datum: The North American Vertical Datum of 1988 (NAVD88) established by the NGS.

Reference Network: CGPS Station VTIS is also a Second Order leveled benchmark and the original basis for the elevations in this survey. The Elevations of CGPS stations following.

CGPS	NAVD88 Ht. (Feet)	
PVE3	235.421	Determined by this Survey based on VTIS and agreeing with NGS BM at Hawthorne & PVDS
PVHS	972.1	Based on a Refined Geoid Model
PVRS	316.37	Based on Second Order Leveling by CSRC
VTIS	315.26	Based on Second Order Leveling by CSRC and the basis for NAVD88 for this survey

Geoid Model: Geoid03 was the available model at the time of the initial 2007 survey. The Geoid09 Model became available from the NGS in 2009 and Geoid12B in 2012; however, Geoid03 is retained to be consistent with prior reported heights and the primary purpose of determining relative height changes over time.

Projection: Plane coordinates are NAD83 California State Plane Coordinates Zone 5 in US Feet: The State Plane Coordinate Parameters follow: The average Scale Factor is 1.00007543 and the Height Reduction Factor based on the average ellipsoid heights is 0.99999092, therefore the average Combined Grid Factor is 1.00006635. Distances in this survey are grid. To obtain ground distances divide grid distances by the above Combined Grid Factor. Grid bearings resulting from this survey must be rotated by a Convergence Angle to obtain geodetic (true) bearings. The average convergence angle is $-0^{\circ}12'30'' \pm$ (rotate left $0^{\circ}12'30''$).

Datum Stability: The City of Rancho Palos Verdes sits on the Pacific Plate which in this vicinity is moving west-northwesterly relative to the North American Plate about 4.4 centimeters (0.14 feet) per year. The area southwesterly of the Fault Line shown on the above map includes the City and is moving at a near constant rate as exhibited by the International Terrestrial Reference Frame (ITRF) north, east and up velocities of the CGPS Stations obtained from SOPAC and listed below.

SITE	ANNUAL VELOCITIES (mtrs)			ANALYSIS PERIOD	
	N	E	Up	START - DATE	END
PVE3	0.019	-0.040	-0.000	2000.73	2019.36
PVHS	0.019	-0.040	0.000	1999.51	2019.36
PVRS	0.019	-0.039	0.000	1999.09	2019.36
VTIS	0.019	-0.039	-0.001	1998.94	2019.36

These CGPS Stations surround the Portuguese Bend Landslide and provide a rigid reference frame from which to validate the stability of the monitoring network during each survey campaign. See the MSC September 2007 Monitoring Survey Report and the adjustment results below for validation of network stability.

FIELD SURVEYS, DATA COLLECTION, EQUIPMENT & PROCESSING

Two Leica GS15 geodetic GNSS receivers/antennas listed below were mounted on two-meter fixed height poles to collect satellite signal data. The receivers tracked the Global Navigation Satellite Systems (GNSS) consisting of Navstar GPS, GLONASS, and Galileo satellites. A calibration of the poles was conducted to verify their heights and plumb are within 0.003 feet (1 mm) consistent with prior years. There were no equipment failures.

65 monitoring points were occupied and reported in this October 2018 survey. Site photographs and recovery sheets detailing the location, character of the monuments and obstructions were updated. See the Appendix for

"Monitoring Point Status". Point AB61, established in September 2007 sits on Portuguese Point above a stable basalt formation and was used as the primary base station up through October 2018. In January 2019, Point AB20 became the primary base station because of its central location, secured access and no impact on the ecosystem; however, future surveys will continue to be referenced to AB61 and PVE3 as described herein.

The October 2018 field survey commenced each day by setting a Leica GS15 GNSS receiver in static mode on a fixed height pole at AB61. A roaming GS15 operating in static mode collected observations on a fixed height pole at the remaining 64 points.

Points with annual movements less than 5 centimeters were measured with two or more independent occupations by each roving receiver resulting in a minimum of two vectors to each point from AB61. An independent occupation means the points were occupied under a different constellation of satellites usually on a different day. Residuals in the measured vectors within 0.03 feet (1 cm) horizontally are accepted, otherwise additional measurements are required. Experience has shown the measurements generally agree less than 0.02 feet. The CGPS stations were connected with nine 2-7 hour observations collected over eight days. Points in the active areas with annual movements greater than 5 centimeters were single occupied by each roving receiver and a comparison with the linear movements from prior years was made to verify the measurement accuracy. AB12 was single occupied due to restricted access. AB12 will be replaced with AB70 in the October 2019 Survey.

Trees and foliage that over-shadow points interfere with signals received from satellites and affect the quality of measurements. To obtain the best possible accuracies, the varying satellite constellation is compared with obstruction diagrams to estimate the best time for observing the greatest number of satellites. To improve the accuracy of the measurements, satellites that are obstructed by trees and foliage are either turned off during the observation or noted for removal in post-processing. Generally, 12 or more un-obstructed satellites are available supporting a static type solution based on 15 minutes of data collection. If the satellite geometry and number of satellites are insufficient then the receiver is moved to another point and returned later when satellite availability improves.

Date of Survey: M22^s 09/12-13/18 and 10/07-13/18 (mean date 10/10/2018) between 0700-1800 PDST (+7 hrs for UTC).

GNSS Survey Parameters:

Constellation: 31 US NAVSTAR GPS satellites, 24 Russian GLONASS and 13 Galileo Satellites.

Observables: L1 & L2 Carrier Waves on GPS and GLONASS, and four Carrier Waves on Galileo Satellites

Epoch Rate - Occupation Times: 15 second epoch rate for 15 minute occupations at monitoring points and nine 2-7 hour occupations at the base station AB61.

Satellites: 15-24; GDOP \leq 3; Elevation Mask for Data Collection at 15°

Ephemeris: Precise for Static Post-Processing of CGPS baseline connections and Broadcast for onsite baselines.

Weather: Mostly clear skies, temperature 66°-75° F, no significant weather.

Space Weather: Boulder K Index 2-5 averaging 3 (gauges ionospheric activity on a scale of 0-9; less than 6 preferred)

Equipment:

GNSS Base Receiver Unit No.: M8, Operator: M. McGee, PLS; Occupied Base Station: AB61

Make & Model: Leica GS15 with integrated Antenna; Mount: Fixed Height Pole #1; Antenna Height: 1.801m

GNSS Rover Receiver Unit No.: M9, Operator: M. McGee, PLS

Make & Model: Leica GS15 with integrated Antenna; Mount: Fixed Height Pole #3; Antenna Height: 1.800m

Rinex files (satellite observations) for the CGPS Stations were downloaded from the SOPAC website. Vectors were processed using Leica Infinity v3.0 post processing software with Absolute Antenna Models obtained from the NGS website. Network adjustments and analysis were performed with "Starnet-PRO" version 9.1.4.7868 Software.

NETWORK

AB61 is the primary Base Station situated on Portuguese Point a relatively stable location and the focal point of the network connecting the monitoring points and CGPS Stations. Sixty-five points and four CGPS Stations were connected with 140 measured vectors. See the following Aerial Network Maps.

The monitoring plan utilizes the CGPS Stations to verify the stability of the reference frame. PVE3 is the primary CGPS Station used to control this survey. PVE3 is located south of RPV City Hall and 1.8 miles west-northwest of Base Station AB61. CGPS Stations PVE3, PVRS and VTIS are used to validate the stability of the network. Note: Some Stations are occasionally off-line during a monitoring campaign as stated in the reports.

CGPS Stations & Monitoring Network (north left)

MONITORING POINT HISTORY & STATUS

The October 2018 survey is the 22nd Monitoring Survey. For data management purposes during the field survey and data processing, the point names are prefixed with a sequential number to distinguish between monitoring surveys. For example, on the 16th monitoring survey AB61 was named M16AB61 where M16 indicates the sequence number since the initial M01 September 2007 Monitoring Survey. The prefix is stripped in the "COORDINATES LIST" and "PB MOVEMENT DATA POSTING" documents.

2007: Between 1994 and 2006, 149 monitoring points were established to monitor the Portuguese Bend Landslides, many of which were lost or destroyed. Sixty of the original points were recovered in 2007. Eight of the 60 points were deleted because they were near other points better suited for GNSS satellite measurements leaving 52 original points monitored in September 2007 and movements reported between September 2006 and September 2007. Three of the 52 points (AB09, KC11 & PB51) were monitored in September 2007 for the last time and replaced by new points set nearby and better suited for satellite observations. Eighteen new points were set and surveyed in 2007 and had their movements reported for the first time in the following December 2008 survey.

2008: In December 2008, 49 original and 18 new points were surveyed for a total of 67 monitoring points. In December, it was noted that AB05 had been disturbed by a mowing machine. AB05 was found chipped and leaning to southerly about 0.4'. The movement reporting resumed in 2009. Analysis of the movement and historic data made it possible to estimate the disturbance to within 0.05'. The original 1995 position of AB05 was re-referenced S14°E 0.29' to be consistent with the disturbed position, resulting in correct overall reported movements. Note, KC01 was previously reported by others on 9/14/2006 to have moved N 29°E 1.24' from its 12/09/2003 position. In September 2008, this survey found a buried partially illegible brass cap in concrete stamped "COUNTY ENGINEER RE8869 1956 STA ??IELDS" S31°W 1.48 feet from the 1" IP used by on the 2005 and prior surveys. Since the initial September 2007 MSC survey used the 1" IP all subsequent surveys will use said pipe for consistency. The original 1994 position of KC01 (brass cap) was re-referenced to the 1" IP, resulting in a correct overall movement as reported by this survey.

2009: PB64 was set east of the Archery Range to replace PB63 (set in 2007) which had become unsafe to access and was lost in 2010. PB64 was reported for the first time in October 2010.

2010: Points AB03 and BB25 were discontinued. AB03 is on the edge of a cliff 192 feet west-southwest of AB61 making it redundant, and BB25 is on a freestanding rock susceptible to disturbance by wave action. In the summer of 2010, PB62 was destroyed by road construction and in October 2010, PB65 was set 24' south-southwest of PB62's location and reported for the first time in October 2011. The following points may have been disturbed prior to the October 2010 survey: AB05 appears to have been disturbed by mower machinery, AB15 (½" GIP in a meter box) is driven over by vehicles occasionally accessing an adjacent field, and KC02 (½" GIP in a meter box) is occasionally parked on by vehicles accessing the beach.

2011: In October, new points AB62 and AB63 (initially referred to as AB62R and AB63R) were set to replace AB06 and AB07 which were hazardous to occupy due to their location near the traveled way of Palos Verde Drive South.

2012: In September, prior to initiating the survey, eight new monuments AB64, AB65, AB66, AB67, AB68, CR53, KC17 and PB66 were constructed to replace AB54, AB18, AB52, AB55, AB15, CR52, KC04 and PB53 respectively. The monuments were replaced because of poor sky visibility except for KC04 which was difficult to access and AB55 which was destroyed by trenching in the past year. Monuments were set with the following design as noted in the "Point Descriptions": Monuments set in soil are 1" x 5" GIP driven flush and encase in a 6" PVC pipe sitting on a concrete collar down 12-18". Monuments set in asphalt are 1/2" x 2" rebar driven below the surface inside a free floating 2" plastic collar encased in concrete. Points AB15, AB18, AB52, AB54, CR52, KC04 and PB53 were monitored (surveyed and reported) for the last time in 2012 and discontinued.

2013: BB52 is on a freestanding rock susceptible to disturbance by wave action and was monitored for the last time in October and discontinued.

2014: In April PB64 was monitored for the last time due to unsafe access conditions and PB67 (a 5' t-bar steel post driven 3' into the ground) was set north-northwesterly about 250' as a replacement and reported for the first time in September 2014 after 4.5 months whereas all other points in the "PB MOVEMENT DATA POSTING" are reported for 11.5 months since October 2013. In September, AB69 located about 260' NE of AB12 and

AB70 located about 150' SE of AB12 were set as potential replacements; however, AB69 was destroyed by lot improvements and AB70 proved to be too obstructed for accurate results.

2015: In April, new points PB68, PB69 and PB70 were set to monitor movements of "Palos Verdes Drive South" and reported in October. In October, Monitoring Point AB56 was found disturbed by construction and AB71 (magnetic nail in AC) was set as a temporary replacement. In October, the steel post for PB67 was not found (removed by others) therefore an inconspicuous ½" x 4' rebar was set flush in its place. Because of the large movement in this area a more permanent monument is not necessary.

2016: In October, the temporary point set for AB71 in October 2015 was determined to have been destroyed by road work. AB71 was reset 12' easterly with a 2" screw and brass washer drilled into a granite curb on the south side of Vanderlip Road. Movement information will be available in the fall of 2017.

KC16 was raised about 0.29' to the surface of the road by others between the two occupations in October 2016.

2017: Movement of AB71 (replacement for AB56) reported for the first time in October.

2018: KC14 was raised 0.19' to the surface of the road by others on 11/15/17. PB25 was deleted from the monitoring since PB26 nearby provides the similar movement information.

2019: AB12 is difficult to access because it is in a horse corral and on private land. AB70 was set in 2014 as a future replacement for AB12 in a cul-de-sac at the southeast end of Figtree Road. AB70 is an obstructed site; however, improvements in receiver technology now make accurate measurements possible; therefore, AB70 was measured May 20, 2019 and found to be S33-30E 148.26' and 29.1' lower than AB12. The velocity of AB12 over the last 4.2 years was S24W 0.12' per year and at AB70 was S25W 0.09' per year. AB70 will be substituted on future surveys.

ADJUSTMENTS & ANALYSIS

Adjustment 1: An adjustment to develop NAD83 (2007) 2007.00 Epoch Latitude, Longitude, Ellipsoid Heights and State Plane Coordinates. CGPS Station PVE3 was fixed at its published NAD83 (2007) Epoch 2007.00 position listed above in a Minimally Constrained Adjustment to determine positions of points in this survey and verify its stability relative to other CGPS stations. PVE3 is located 1.8 miles westerly of and outside the influence of the slide area and has been fixed in all adjustments since 2007. The SOPAC published Time Series indicates the horizontal and vertical position of PVE3 is stable. The on-site base station(s) and other operating CGPS Stations are measured relative to PVE3 and used to assess stability of the survey reference frame. The results are listed in the Coordinate List in the Appendix. Differences between surveys for key points are listed in the table below in feet.

Original 9/2007 Positions to 10/10/2018				10/04/2017 Positions to 10/10/2018			
ID	dN	dE	dZ	ID	dN	dE	dZ

AB17	-0.025	-0.024	-0.074	AB17	0.001	-0.010	-0.104
AB61	-0.017	-0.003	-0.008	AB61	-0.008	-0.010	-0.083
CR50	-0.035	-0.017	-0.053	CR50	-0.002	0.004	-0.060
CR51	-0.033	0.006	-0.183	CR51	0.003	-0.001	-0.096
KC16	-0.001	-0.004	0.311	KC16	0.013	0.003	-0.070
PVE3	-0.000	-0.000	-0.000 < Fixed	PVE3	-0.000	-0.000	-0.000
PVHS	-0.004	0.010	-0.000	PVE3RP	0.008	-0.009	0.003
PVRS	-0.007	0.023	-0.009	PVHS	-0.002	-0.006	0.035
VTIS	0.004	0.001	-0.014	PVRS	0.001	0.006	-0.022
				VTIS	0.004	-0.009	-0.014

Comments: There are no significant horizontal differences at the Base Station AB61 compared to the October 2017 and 2007 surveys. Given that PVE3 agrees with AB61 and the other CGPS Stations, the survey reference frame is deemed stable and successfully recovered. The vertical differences between 2017 and 2018 will have to be analyzed by the City Geologist; however, this survey included sufficient redundant measurements to assure the differences reported here with the accuracy requirement. An adjustment constrained to the other CGPS Stations is not necessary because the purpose here is to track the relative monitoring point movements over time

and test the stability of the monitoring network reference frame. See the appended “COORDINATE LIST” and prior Survey Reports for prior years coordinate lists.

Adjustment 2: An adjustment to develop NAVD88 Orthometric Heights (Elevations). The CGPS Station PVE3 was fixed horizontally at its NAD83 position and vertically at its NAVD88 Height determined in the September 2007 Survey. The 2007 Height was based on the published 2nd Order NAVD88 Height of CGPS Station VTIS. This Adjustment combines the measured ellipsoid height differences with the NGS Geoid03 Model (models the separation between the ellipsoid and geoid surfaces) to determine the NAVD88 orthometric heights of the CGPS Stations and monitoring points. See the appended Coordinate List for NAVD88 Heights.

ACCURACY

This survey conforms to the intent of the California Spatial Reference Center and California Lands Surveyors Association’s “GNSS Surveying Standards and Specifications, 1.1” (2014) and the Federal Geodetic Control Subcommittee (FGCS) “Specifications for GPS Relative Positioning” (1988).

Vector Residuals: The vector lengths, two dimensional residuals and the absolute value of the vertical residuals are listed below in feet. Vectors to single occupied points are excluded to avoid optimistically skewing the results; however, the statistics given below are applicable to all measurements. Analysis of residuals resulting from minimally constrained Adjustment #1 led to the rejection of 10 of 33 vectors connecting the CGPS Stations to the Base Station and 8 out of 107 on-site vectors connecting the Base Station to Monitoring Points.

Network	Vector Lengths		Two Dimensional Residuals			Vertical Residuals (absolute)		
	Vary	Average	Average	Std.Dev.	Maximum	Average	Std.Dev.	Range
Mon. Pts	13-9396	3972	0.009	0.006	0.029	0.008	0.008	-0.034 to +0.024
CGPS	9397-26102	16935	0.010	0.007	0.034	0.004	0.016	-0.029 to +0.032

Movement Accuracy: The relative movements reported between October 4, 2017 and October 10, 2018 (12.2 months) statistically attained an average accuracy of 0.03 feet at the 95% Level of Confidence. The actual accuracy of measurements held to the “one-centimeter standard” are estimated to be less than 0.02 feet as demonstrated by the vector residuals, repeatability of measurements at points considered stable, and deflection analysis. Refer to the sections titled ACCURACY and QAQC ANALYSIS in this Report for more information.

As a matter of information, the probability at the 95% level of confidence is that movement (signal) has occurred at a point when the horizontal distance between two epochs is greater than the 95% Error (noise). No movement is considered detected unless the movement exceeds the 95% Error for individual points. See the attached “PB MOVEMENT DATA POSTING 2007-2018.10.xlsx” for the relative movements and the estimated error at the 95% Level of Confidence for individual points.

NAVD88 Heights: The North American Vertical Datum of 1988 orthometric heights resulting from Adjustment #2 are derived from the difference in ellipsoid heights combined with the Geoid03 Model and constrained to the NAVD88 height of PVE3. The NAVD88 Height was determined in 2007 based on the second order orthometric height of CGPS Station VTIS. The relative accuracy of the heights is expected to be 0.03 feet, or greater at obstructed sites. The absolute accuracy of the heights relative to the datum is dependent on the published orthometric height on the Station VTIS. Up until October 2011 there were no specific requirements for vertical accuracies. In October 2011, a 0.03-foot relative vertical accuracy preference was introduced for points AB17, AB57, CR07, CR50 and CR51. In the September 2012 and subsequent surveys, the preference was extended to include all points.

QUALITY CONTROL - QUALITY ASSURANCE (QAQC) ANALYSIS

To ensure the accuracy and validity of the measurement systems used in these GNSS monitoring surveys, an independent test was conducted in 2007 using conventional terrestrial based instruments as reported in the "QAQC ANALYSIS" section of the September 2007 Monitoring Survey Report. Comparing the results of the GNSS systems with conventional instrumentation found horizontal measurements agreed 0.01 feet on average. In November 2011, the GNSS instruments and fixed height poles used in this survey were calibrated on the National Geodetic Survey's Santa Maria Baseline and found to agree 0.003 to 0.006 feet with the published distances. In February 2018, the GNSS instruments and fixed height poles were calibrated on the NGS Camarillo Baseline and found to agree 0.003 feet with the published distances.

To validate the radial survey method used in these surveys to position points from base stations AB61 and/or AB20, independent GNSS intra-net cross connections were measured and compared with the stand alone computed inverse distances in the 2007, 2008 and 2009 surveys. The results found the two-dimensional accuracy to agree 0.01 feet on average, indicating the radial method of measurements is reliable. Therefore, the additional labor cost of measuring cross connection between points is of no benefit when it comes to the integrity or accuracy of these surveys. See the "QAQC ANALYSIS" section of the September 2007 and the December 2008 Monitoring Survey Reports for detailed analysis.

Deflection Analysis is a method established by this surveyor to assess the consistency of the direction of movements reported from period to period with the overall. Assuming that movements are generally linear, the separation or the deflection from the overall direction to the present direction is an implication of the accuracy obtained with these procedures since the expectation is zero (no deflection). Analysis of the individual movement deflections finds the implied accuracy varies 0.01 to 0.02 feet.

SUMMARY

Point movement ranges by landslide zones are listed below in feet:

(AB##) 0.00 to 0.11
(CR##) 0.00 to 0.06
(FT##) 0.02 to 0.12
(KC##) 0.01 to 0.08
(PB##) 0.07 to 1.34 and 3.94 at PB67
(UB02) 0.97

See the Appendix for a graphic of the horizontal movements depicted by 1" and 1' contours.

See the attached " PB MOVEMENT DATA POSTING 2007-2018.10.xlsx " spreadsheet for overall and periodic movements of each point. The movements are given in north, east and up or down as well as a vector of distance and direction relative to north. The direction is given as an azimuth in degrees where 0° is north and increases clockwise (90° East, 180° South, 270° West). The overall movements listed in the spreadsheet are from the date when a point was established to the present survey.

RECOMMENDATION

Re-locating obstructed monuments has long term benefits resulting in better accuracy and lower cost surveys due to improved sky visibility for tracking satellites; however, alternate locations are not always suitable for geological analysis. Points AB16, AB17, AB24, AB58 and PB18 have limited sky visibility and would benefit from tree trimming. PB18 was completely overgrown in May 2019 and the adjacent shrubbery and Pepper Tree must be cleared.

ATTACHMENTS

The following document is attached to this Report: "PB MOVEMENT DATA POSTING 2007-2018.10.xlsx" listing the coordinates of the initial positions and all subsequent monitoring surveys with the overall and periodic movements of monitoring points since 2007.

SURVEYOR'S STATEMENT

This is a Report on the procedures, criteria and results of the City of Rancho Palos Verdes Portuguese Bend Landslide Monitoring Surveys. This Report includes the Initial Fall Survey, the Second Winter (Addendum No.1) and the Third Spring Survey (Addendum No.2). This survey was conducted and the report prepared by me at the request of Ron Dragoo, Principal Engineer of the City of Rancho Palos Verdes.

- 13- Table of Horizontal and Vertical Movements
- 14- Aerial Photo of Monitoring Points with Movements and Contours
- 15- Monitoring Point Status
- 16- Coordinate List for the Oct. 10, 2018 Survey: NAD83 (2007) Epoch 2007.00 Geodetic, Grid, NAVD88
- 17- ADDENDUM No. 1: Second Survey – January 29, 2019 Partial Monitoring Survey No. 23
- 17- ADDENDUM No. 2: Third Survey – May 7, 2019 Partial Monitoring Survey No. 24
- 18- Table of Partial Monitoring Survey Horizontal and Vertical Movements

Table of Annual Movements of Monitoring Points

Portuguese Bend Landslide Monitoring Horizontal and Vertical Movements in Feet October 4, 2017 to October 10, 2018 - 12.2 Months

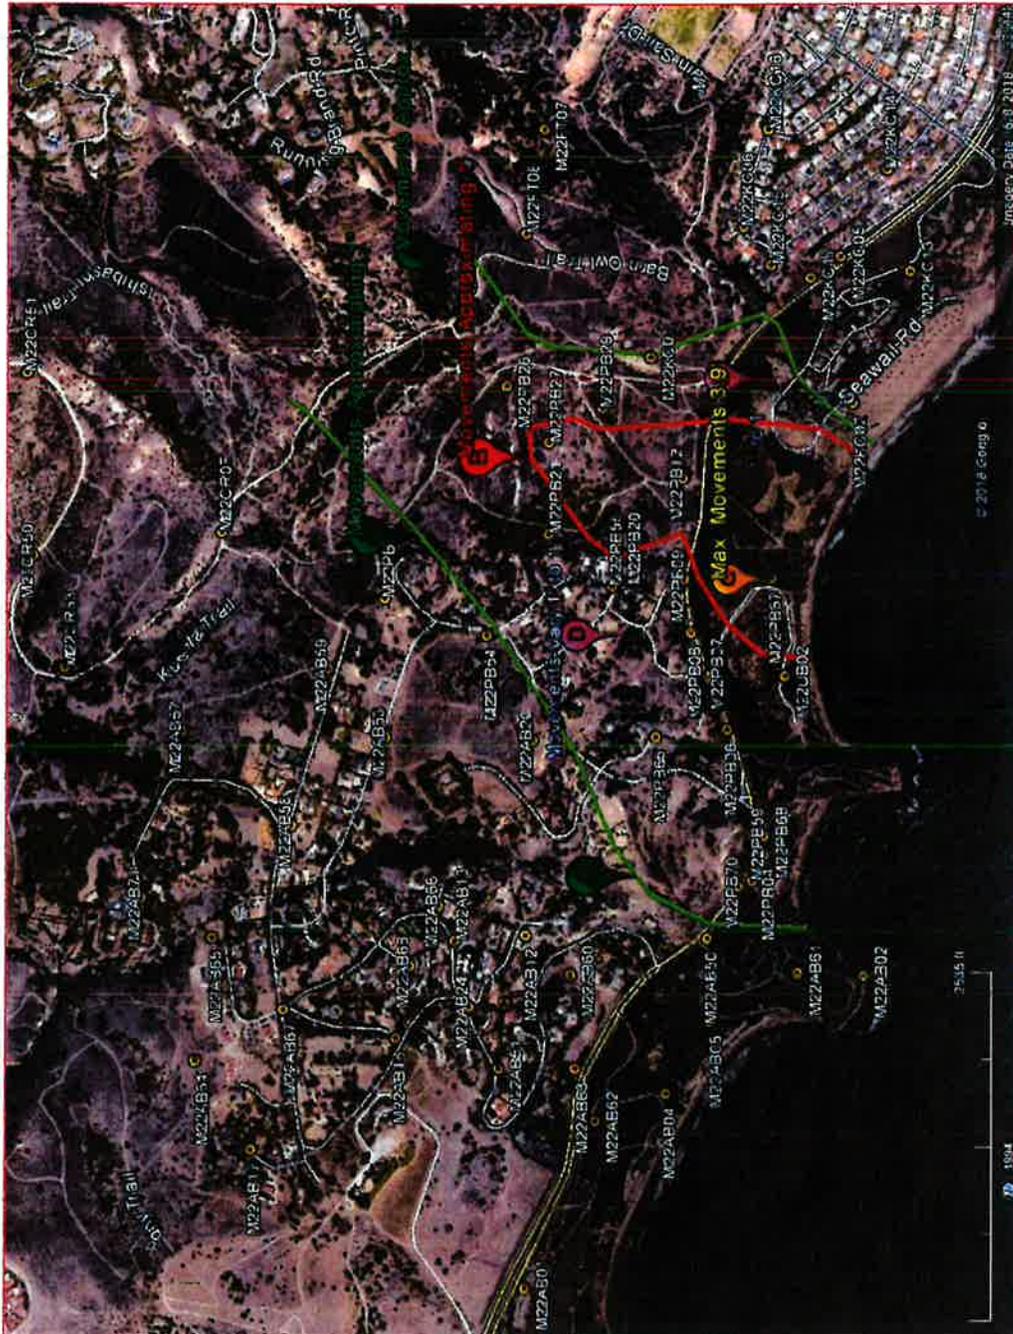

Listed below are the horizontal movements and vertical (elevation) changes during the above annual period. See the attached spreadsheet titled "PB MOVEMENT DATA POSTING 2007-2018.10.xlsx" for more details and a history of movements. Note: The measurement confidence is 0.02' (1/4"); therefore, movements of 0.02' or less are deemed to have not moved.

Addendum No. 1

Monitoring Survey No. 23 Report Portuguese Bend Landslide Monitoring January 29, 2019 Partial Monitoring Survey for the City of Rancho Palos Verdes by McGee Surveying Consulting

Addendum No. 1 Report briefly describes the second tri-annual Portuguese Bend Monitoring Survey M23. The field survey took place January 28-31, 2019 (average date 01/29/19). This partial survey included 30 points which are a sub-set of the full monitoring array reported in October 2018. A Minimally Constrained Adjustment was processed to develop NAD83 (2007) Epoch 2007.00 Geodetic and State Plane Coordinates in feet. The adjustment fixed CGPS Station PVE3 and included two other CGPS Stations PVRS and VTIS with three 3-9 hour observations (PVHS not operating). The CGPS stations are known to be stable over time and indicated the survey reference frame was stable and successfully recovered.

For a detailed history of the program and surveys see “History” above and the Monitoring Survey Reports by MSC dating back to 2007. The Field Surveys, Equipment, Data Collection and Network Design were as described in the above Report with the following addition.

A new Leica GS18T GNSS Receiver was acquired for this project with the future expectation of improving productivity. The GS18 was used to duplicate the survey effort by double occupying all points as a test to compare the accuracy of the GS18 with GS15 Receivers used since 2010. The GS18 incorporates an advanced algorithm with an Inertial Measurement Unit (IMU) to eliminate the need for leveling the instrument. Comparing the results of the two independent surveys found an increase in production with the GS18 with a small loss in accuracy. The results will be addressed in the October 2019 Survey Report. Movements are summarized in the “Periodic Horizontal & Vertical Movement in Feet” below.

Addendum No. 2

Monitoring Survey No. 24 Report Portuguese Bend Landslide Monitoring May 7, 2019 Partial Monitoring Survey

Addendum No. 2 Report briefly describes the second tri-annual Portuguese Bend Monitoring Survey M24. The field survey took place May 5-8, 2019 (average date 05/07/19). This partial survey included 28 points which are a sub-set of the full monitoring array reported in October 2018. Points AB04, FT07, PB12 and PB18 were overgrown and not accessible. AB12 has access issues as it is located on private land used for a horse corral with guard dogs. AB70 established in 2014 was recovered and will be used as a future substitute for AB12 as noted in “History” above. A Minimally Constrained Adjustment was processed to develop NAD83 (2007) Epoch 2007.00 Geodetic and State Plane Coordinates in feet. The adjustment fixed CGPS Station PVE3 and included two other CGPS Stations PVHS and VTIS with four 3-7 hour observations. The CGPS stations are known to be stable over time and indicated the survey reference frame was stable and successfully recovered.

For a detailed history of the program and surveys see “History” above and the Monitoring Survey Reports by MSC dating back to 2007. The Field Surveys, Equipment, Data Collection and Network Design were as described in the above Report with the following addition.

The Leica GS18T GNSS Receiver discussed above was used to double and triple occupy all points in this survey utilizing a GS15 receiver as a base station. The results of the January 2018 survey with the GS18 were found to be similar to past results with the GS15. Based on the January test results, the GS18 Receiver was substituted on this survey for the roaming GS15 Receiver used since 2010. On the next monitoring survey in October 2019 the application of the GS18 will be fully implemented which will increase production with little loss in precision resulting in an accumulated cost savings for the City over the next few years. Movements are summarized in the "Periodic Horizontal & Vertical Movement in Feet" below.

Note: Columns 4-7 revised 07/09/19

Survey Report

of the

Portuguese Bend Landslide 2017-2018 Monitoring Surveys

Dated: December 4, 2017, Appended March 23, 2018 and April 23, 2018

for the
City of Rancho Palos Verdes
prepared by
McGee Surveying Consulting

The Portuguese Bend Landslide is monitored on a tri-annual basis beginning with the primary survey of 66 Monitoring Points at the beginning of the rainy season in September-October of each year. The primary survey is addressed in this Report and two subsequent partial monitoring surveys of 30 Points conducted in mid-winter and mid-spring are addressed as Addendums No. 1 and No. 2 to this Report. Consequently, this Report is issued three times with the third being the final Report for the rainy season. The average date of each survey follows.

Initial Survey - October 4, 2017 Full Monitoring Survey No. 19 Report
Second Survey - February 12, 2018 Partial Monitoring Survey No. 20 Report
Third Survey - April 16, 2018 Partial Monitoring Survey No. 21

Survey Report
of the
Portuguese Bend Landslide Monitoring Survey
October 4, 2017 Initial Monitoring No. 19
for the
City of Rancho Palos Verdes
Prepared December 4, 2017 Revised March 23, 2018
by
McGee Surveying Consulting

PROJECT OVERVIEW:

McGee Surveying Consulting performed a landslide monitoring survey in October 2017 at Portuguese Bend on behalf of the City of Rancho Palos Verdes. This survey established positions on monitoring points to determine overall and periodic movements. The results of the survey are described in this Report and in the attached annual spreadsheet titled "PB MOVEMENT DATA POSTING 2007-2017.10 rev.xlsx". Two partial monitoring surveys follow in the winter and spring and are reported as addendums to this Report.

The field surveys are planned, coordinated and executed by Michael McGee, PLS3945 of McGee Surveying Consulting who is also responsible for the final processing of the observations, network adjustments, analysis and reports. Sixty-six monitoring points covering a 1.5 by 2 mile area were measured to determine the rate and extent of ground movement as reported herein. The City of Rancho Palos Verdes assumed responsibility for monitoring the Portuguese Bend Landslide Complex circa 1994 from the County of Los Angeles. The Global Navigation Satellite System (GNSS) formerly referred to as GPS technology is used to measure positions of points because of its high accuracy and cost efficiency. The horizontal and vertical positions of the monitoring points are based on the North American Datum of 1983 (NAD83) and the North American Vertical Datum of 1988 (NAVD 88). The survey is referenced to physical monuments known as California CGPS (Continuous GPS) Stations in the region which are permanently mounted GPS and GNSS receivers used for monitoring seismic activity. The CGPS in California are comparable to the national CORS (Continuously Operated Reference Stations) network.

Points that move a few inches or less per year are surveyed to meet an accuracy standard of one centimeter (0.033 feet) at the 95% Level of Confidence. In the active slide area where the movements are greater than 0.25 feet per year (PB and UB points), the accuracy standard is two centimeters (0.066 feet) at the 95% Level of Confidence. Field procedures are designed to accomplish this purpose and Quality Control-Quality Assurance (QAQC) processes discussed hereafter are incorporated to verify these accuracies are attained.

Prior to September 2007, successive coordinate differences were used to compute movements; however, arithmetic differences do not provide statistical information about the relative movement accuracies. Beginning with the initial 2007 survey, field and office procedures were designed to assure the accuracy and reliability of measurements and provide for queries between epochs that include statistical information about the relative precisions of the reported movements. Measurements of temporal movements and statistical analysis are based on a rigorous simultaneous least squares adjustment of multiple observations at two different epochs for each monitoring point.

HISTORY

This monitoring survey is a continuation of a program initiated by the County of Los Angeles and taken over by the City of Rancho Palos Verdes circa 1994. McGee Surveying Consulting has conducted the field surveys and reporting since September 2007. The monitoring surveys have occurred annually since 2007, semi-annually since 2012 and three times a year beginning with the September 2014 survey. See the September 2007 Survey

Report for a history of the previous survey process between 1994 and 2007. See the Survey Reports on file with the City commencing in 2007 for details of each monitoring campaign.

PROJECT DATUMS, REFERENCE SYSTEM

Horizontal Datum: The horizontal datum is the North American Datum of 1983 established by the National Geodetic Survey (NGS) referred to as NAD83 (2007) 2007.00 Epoch. The NAD83 (2007) 2007.00 Epoch adjustment is one of a series of national adjustments of the NAD83 Datum since its adoption in 1986 and is the realization used for these monitoring surveys beginning in 2007. The positions listed below were obtained in September 2007 from the California Spatial Reference Center (CSRC). The CSRC provides California Public Resources Code sanctioned positions for the California CGPS Stations. The current national realization of NAD83 is the 2011 adjustment published by the NGS and referred to as the NAD83 (2011) 2010.00 Epoch Adjustment. The CSRC published an updated adjustment of the CGPS stations in California known as the NAD83(2011) 2017.50 Epoch Adjustment. However, the above referenced NAD83 (2007) 2007.00 Epoch realization is retained by this survey to be consistent with prior reporting and the primary purpose of determining relative movements over time.

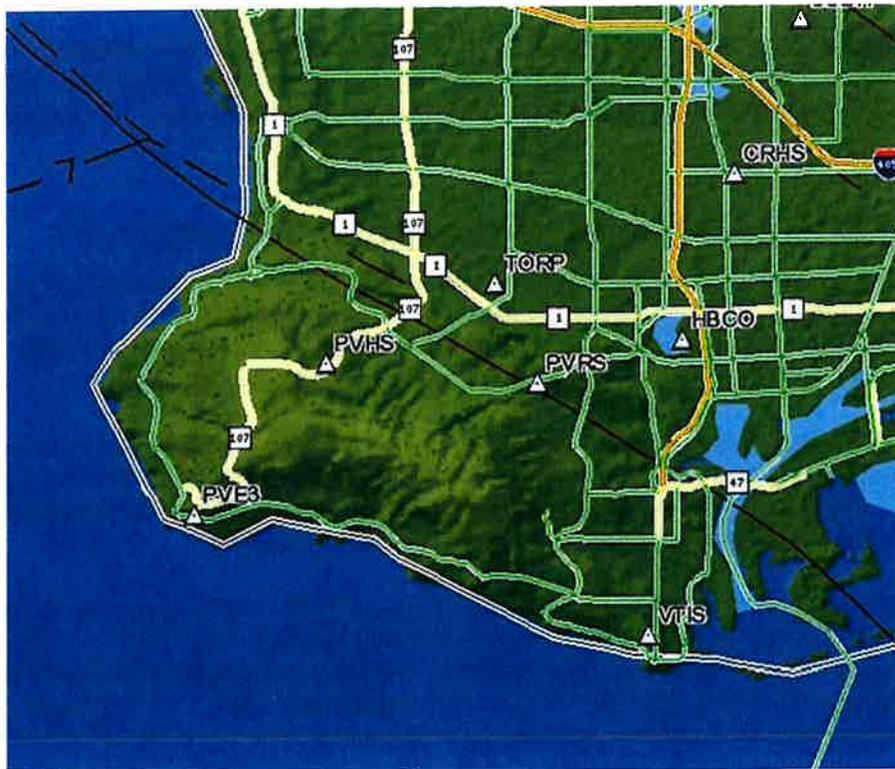

Reference Network: The survey is referenced to the CGPS Stations (continuously operating GPS & GNSS receivers). For more information see NGS Data Sheets for the PID's listed below (no data sheet exists for PVE3) and the CSRC website.

Units: Feet

NAD83 (2007) 2007.00 Epoch									
CGPS	Latitude (dms)			Longitude (dms)			EH (feet)	NGS PID	NAME
PVE3	33	44	35.853290	-118	24	15.269036	235.42	none	PALOS VERDES CORS
PVHS	33	46	46.020150	-118	22	19.741258	853.99	AJ1915	PENINSULA HIGH SCH
PVRS**	33	46	25.891904	-118	19	14.067218	198.63	AJ1916	PALOS VERDES RES
VTIS	33	42	45.489584	-118	17	37.712290	197.52	AJ1936	MARINE EXCHANGE

** Falls in the proximity of a Fault Line as shown below but appears unaffected to date

CGPS Stations (north up)

Vertical Datum: The North American Vertical Datum of 1988 (NAVD88) established by the NGS.

Reference Network: CGPS Station VTIS is also a Second Order leveled benchmark and the original basis for the elevations in this survey. See the Record Elevations of CGPS stations following.

CGPS	NAVD88 Ht. (Feet)	
PVE3	none	
PVHS	972.1	Based on a Refined Geoid Model
PVRS	316.37	Based on Second Order Leveling by CSRC
VTIS	315.26	Based on Second Order Leveling by CSRC and basis for this survey

Geoid Model: Geoid03 available at the time of the initial 2007 survey. Note the Geoid09 Model became available from the NGS in 2009 and Geoid12B in 2012; however, Geoid03 is retained to be consistent with prior reported heights and the primary purpose of determining relative height changes over time.

Projection: Plane coordinates are NAD83 California State Plane Coordinates Zone 5 in US Feet. The State Plane Coordinate Parameters follow: The average Scale Factor is 1.00007543, the Height Reduction Factor based on the average ellipsoid heights is 0.99999092, and the average Combined Grid Factor is 1.00006635. Distances in this survey are grid. To obtain ground distances divide grid distances by the Combined Grid Factor. Grid bearings resulting from this survey must be rotated by a Convergence Angle to obtain geodetic (true) bearings. The average convergence angle is -0-12-30± (rotate left 0-12-30).

Datum Stability: Rancho Palos Verdes sits on the Pacific Plate which is moving west-northwesterly relative to the North American Plate about 4 centimeters (0.14 feet) per year. The area southwesterly of the Fault Line shown on the above map includes the City and is moving at a constant rate as exhibited by the International Terrestrial Reference Frame (ITRF) north, east and up velocities of the CGPS Stations obtained from SOPAC and listed below.

SITE	ANNUAL VELOCITIES (mtrs)			ANALYSIS PERIOD	
	N	E	Up	START DATE	END DATE
PVE3	0.019	-0.040	-0.000	2000.731	2017.828
PVHS	0.019	-0.040	0.001	1999.511	2017.828
PVRS	0.019	-0.039	0.000	1999.095	2017.828
VTIS	0.019	-0.039	-0.001	1998.938	2017.828

These CGPS Stations surround the Portuguese Bend Landslide providing a rigid reference frame from which to validate the stability of the network during each monitoring campaign. See the September 2007 Monitoring Survey Report by McGee Surveying Consulting and the Adjustment results below for validation of network stability.

FIELD SURVEYS, DATA COLLECTION, EQUIPMENT & PROCESSING

Two Leica geodetic GNSS receivers/antennas listed below were mounted on two-meter fixed height poles to collect satellite signal data. The GS15 receivers tracked Navstar GPS, GLONASS, Galileo and BeiDou satellites. A calibration of the poles is conducted to verify their heights and plumb. The poles were found to be plumb within 0.003 feet consistent with prior years. There were no equipment failures.

Sixty-six monitoring points were occupied and reported in this survey. Site photographs and recovery sheets detailing the location, character of the monuments and obstructions were updated. See the Appendix for "Monitoring Point Status". AB61, established in September 2007 on Portuguese Point, is used as the primary base station in each survey because it sits above a stable basalt formation.

The field survey commenced each day by setting a Leica GS15 GNSS receiver on a fixed height pole at AB61 while a second GS15 GNSS receiver roamed freely collecting observations on a fixed height pole at the remaining 65 points. Points with annual movements less than 0.2' were measured with two or more independent occupations resulting in a minimum of two vectors to each point from AB61. An independent occupation means

the points were occupied under a different constellation of satellites usually on a different day. If the two measurements are within 0.03 feet (1 cm) horizontally, they are accepted, otherwise a third measurement is required. Experience has shown the two measurements are generally less than 0.015 feet. AB61 and the CGPS stations were connected with 4-10 hour observations averaging 8 hours collected over six days. Points in the active areas with annual movements greater than 0.2' were single occupied. AB12 was single occupied due to restricted access. A comparison with the linear movements from prior years is made to verify their accuracy.

Trees and foliage that over-shadowed points interfere with signals received from satellites and affect the quality of measurements. To obtain the best possible accuracies, the satellite constellation is compared with obstruction diagrams to estimate the best time for observing un-obstructed satellites. To improve the accuracy of the measurements, satellites that are obstructed by trees and foliage are either turned off during the observation or noted for removal in post-processing. Generally, if six or more un-obstructed satellites with a GDOP of less than four (measure of the geometry or strength of figure of the constellation) are available, then the measurement commences for a minimum of 15 minutes of data collection. If the geometry and number of satellites are insufficient then the receiver is moved to another point and returned later when satellite availability improves.

Date of Survey: 10/01/17 to 10/07/17 (mean date 10/04/2017) between 0600-1800 PDST (+7 hrs for UTC).

GNSS Survey Parameters:

Constellation: 31 US NAVSTAR GPS satellites, 24 Russian GLONASS, 14 Galileo and 18 Beidou Satellites.

Observables: L1 & L2 Carrier Waves on GPS, GLONASS and Beidou, and four Carrier Waves on Galileo Satellites

Epoch Rate - Occupation Times: 15 second epoch rate for 15-minute occupations at monitoring points and six 4-10 hour occupations at the base station AB61.

Satellites: 17-21; GDOP \leq 2; Elevation Mask for Data Collection at 15° and Processing at 15°

Ephemeris: Precise for Static Post-Processing of CGPS connections and Broadcast for onsite.

Weather: Mostly clear skies, temperature 60°-90° F, no significant weather.

Space Weather: Boulder K Index was 0-3 averaging 1-2 (gauges ionospheric activity on a scale of 0-9; less than 6 preferred)

Equipment:

GNSS Base Receiver Unit No.: M8, Operator: M. McGee, PLS; Station Occupied: AB61 (Base1)

Make & Model: Leica GS15; Antenna Leica GS15; Mount: Fixed Height Pole #1; Antenna Height: 1.803m

GNSS Rover Receiver Unit No.: M9, Operator: M. McGee, PLS;

Make & Model: Leica GS15; Antenna Leica GS15; Mount: Fixed Height Pole #3; Antenna Height: 1.800m

Rinex files (satellite observations) for the CGPS Stations were downloaded from the SOPAC website. Vectors were processed using Leica Infinity v2.4 post processing software with Absolute Antenna Models obtained from the NGS website. Network adjustments and analysis were performed with "Starnet-PRO" version 9.0 software.

NETWORK

The primary Base Station AB61 is situated on Portuguese Point and is the focal point of the static network connecting the monitoring points and CGPS Stations. Sixty-six points and three CGPS Stations were connected with 130 vectors. See the following Network Maps and the Aerial View in the Appendix.

The monitoring plan utilizes the CGPS Stations to verify the stability of the reference frame. PVE3 is the primary CGPS Station used to control this survey located just south of City Hall and 1.8 miles west-northwest of Base Station AB61. CGPS Stations PVE3, PVRS and VTIS were used to validate the stability of the network.

MONITORING POINT HISTORY and STATUS

This is the 19th Monitoring Survey. For data management purposes during the field survey and data processing, the point names are prefixed with a sequential number to distinguish between monitoring surveys. For example, on the 16th monitoring survey AB61 was named M16AB61 where M16 indicates the sequence number since the initial September 2007 Monitoring Survey. The prefix is stripped in the "COORDINATES LIST" and "PB MOVEMENT DATA POSTING" documents.

Between 1994 and 2006, 149 monitoring points were established to monitor the Portuguese Bend Landslides, many of which were lost or destroyed. Sixty of the original points were recovered in 2007. Eight of the 60 points were deleted because they were near other points better suited for GNSS satellite measurements leaving 52 original points monitored and reported between September 2006 and September 2007. Three of the 52 points (AB09, KC11 & PB51) were monitored in September 2007 for the last time and replaced by new points, set nearby and better suited for satellite observations.

2007: Eighteen new points were set in 2007 and had their movements reported for the first time in the following December 2008 survey. In September, it was noted that KC01 was previously reported by others on 9/14/2006 to have moved N 29°E 1.24' from its 12/09/2005 position. In September 2008, this survey found a buried partially illegible brass cap in concrete stamped "COUNTY ENGINEER RE8869 1956 STA ??IELDS" S31°W 1.48 feet from the 1" IP used by the previous survey and this survey in the initial September 2007 and subsequent surveys. The original 1994 position of KC01 (brass cap) was re-referenced to the 1" IP, resulting in a correct overall movement as reported by this survey.

2008: In December 2008, 49 original and 18 new points were surveyed for a total of 67 monitoring points. In December, it was noted that AB05 had been disturbed by a mowing machine. AB05 was found chipped and leaning to southerly about 0.4'. The movement reporting resumed in 2009. Analysis of the movement and historic data made it possible to estimate the disturbance to within 0.05'. The original 1995 position of AB05 was re-referenced S14°E 0.29' to be consistent with the disturbed position, resulting in correct overall reported movements.

2009: PB64 was set east of the Archery Range to replace PB63 (set 2007) which had become unsafe to access and was lost in 2010. PB64 was reported for the first time in October 2010.

2010: Points AB03 and BB25 were discontinued. AB03 is on the edge of a cliff 192 feet west-southwest of AB61 making it redundant, and BB25 is on a freestanding rock susceptible to disturbance by wave action. In the summer of 2010, PB62 was destroyed by road construction and in October 2010, PB65 was set 24' south-southwest of PB62's location and reported for the first time in October 2011. The following points may have been disturbed prior to the October 2010 survey: AB05 appears to have been disturbed by mower machinery, AB15 (½" GIP in a meter box) is driven over by vehicles occasionally accessing an adjacent field, and KC02 (½" GIP in a meter box) is occasionally parked on by vehicles accessing the beach.

2011: In October, new points AB62 and AB63 (initially referred to as AB62R and AB63R) were set to replace AB06 and AB07 which were hazardous to occupy due to their location near the traveled way of Palos Verde Drive South.

2012: In September, prior to initiating the survey, eight new monuments AB64, AB65, AB66, AB67, AB68, CR53, KC17 and PB66 were constructed to replace AB54, AB18, AB52, AB55, AB15, CR52, KC04 and PB53 respectively. The monuments were replaced because of poor sky visibility except for KC04 which was difficult to access and AB55 which was destroyed by trenching in the past year. Monuments were set with the following design. Monuments set in soil are 1" x 5' GIP driven flush and encase in a 6" PVC pipe sitting on a concrete collar down about 18". Monuments set in asphalt are 1/2" x 2' rebar driven below the surface inside a free floating 2" plastic collar encased in concrete.

2013: Points AB15, AB18, AB52, AB54, CR52, KC04 and PB53 were surveyed for the last time in 2012 and discontinued. BB52 is on a freestanding rock susceptible to disturbance by wave action and was monitored for the last time in October and discontinued.

2014: In April PB64 was monitored for the last time due to unsafe access conditions and PB67 (a 5' t-bar steel post driven 3' into the ground) was set north-northwesterly about 250' as a replacement and reported for the first time in September 2014 after 4.5 months whereas all other points in the "PB MOVEMENT DATA POSTING"

are reported for 11.5 months since October 2013. In September, AB69 located about 260' NE of AB12 and AB70 located about 140' SE of AB12 were set as potential replacements; however, AB69 was destroyed by lot improvements and AB70 proved to be too obstructed for accurate results.

2015: In April, new points PB68, PB69 and PB70 were set to monitor movements of "Palos Verdes Drive South" and reported in October. In October, Monitoring Point AB56 was found disturbed by construction and AB71 (magnetic nail in AC) was set as a temporary replacement. In October, the steel post for PB67 was not found. An inconspicuous ½" x 4' rebar was set flush in its place. Because of the large movement in this area a more permanent monument is not necessary.

2016: In October, the temporary point for AB71 was destroyed by road work prior to this survey. AB71 was reset 12' easterly with a 2" screw and brass washer drilled into a granite curb on Vanderlip Road. No movement information will be available until the fall 2017. KC16 was raised about 0.29' to the surface of the road by others between the two October 2016 occupations.

2017: Movement of AB71 (replacement for AB56) reported for the first time in October.

ADJUSTMENTS & ANALYSIS

Adjustment 1: An adjustment to develop NAD83 (2007) 2007.00 Epoch Latitude, Longitude, Ellipsoid Heights and State Plane Coordinates. CGPS Station PVE3 was fixed at its published NAD83 (2007) 2007.00 Epoch position listed previously in a Minimally Constrained Adjustment to determine positions of points in this survey and verify its stability relative to other CGPS stations. PVE3 is located 1.8 miles westerly of and outside the influence of the slide area and has been fixed in all adjustments since 2007. The SOPAC published Time Series indicates the horizontal and vertical position of PVE3 is stable. The primary base station AB61 and other operating CGPS Stations were measured relative to PVE3 and used to assess stability of the survey reference frame. The positions are based on six 4-10 hour occupations (observations). The results are listed in the Coordinate List in the Appendix. Differences between surveys for key points are listed in the table below in feet.

09/2014 Positions to 10/2015					9/2007 Positions to 10/2015

KC16	-0.004	-0.003	0.059		KC16	-0.014	-0.006	0.381

Comments: The Base Station AB61 has no significant differences since October 2016 and 2007 as referenced to PVE3. Given that PVE3 and AB61 agree, the survey reference frame is deemed stable and successfully recovered. An adjustment constrained to the other CGPS Stations is not necessary because the purpose here is to track their movements over time to test the stability of the reference frame and validate the measured movements. See the “COORDINATE LIST” in the Appendix for a list of coordinates resulting from this adjustment. See prior Survey Reports for coordinates resulting from earlier surveys.

Adjustment 2: An adjustment to develop NAVD88 Orthometric Heights (Elevations). The CGPS Station PVE3 was fixed horizontally at its NAD83 position and vertically at its NAVD88 height determined in the September 2007 survey. The 2007 height was based on the published 2nd Order NAVD88 Height of CGPS Station VTIS. This Adjustment combines the measured ellipsoid height differences with the NGS Geoid03 Model (models the separation between the ellipsoid and geoid surfaces) to determine the NAVD88 orthometric heights of the CGPS Stations and monitoring points. The results are listed in the Coordinate List in the Appendix.

ACCURACY

This survey conforms to the intent of the California Spatial Reference Center & California Lands Surveyors Association’s “GNSS Surveying Standards and Specifications, 1.1” (2014) and the Federal Geodetic Control Subcommittee (FGCS) “Specifications for GPS Relative Positioning” (1988).

Vector Residuals: The vector lengths, two dimensional residuals and the absolute value of the vertical residuals are listed below in feet. Analysis of residuals resulting from minimally constrained Adjustment #1 led to the rejection of 4 out of 21 vectors connecting the CGPS Stations to the Base Station AB61 with 4-10 hour observations and 0 out of 108 vectors connecting AB61 to monitoring points with 15 minute observations. Vectors to single occupied points are excluded to avoid optimistically skewing the results; however, the statistics given below are applicable to all measurements.

Network	Vector Lengths		Two Dimensional Residuals			Vertical Residuals (absolute)		
	Vary	Average	Average	Std.Dev.	Maximum	Average	Std.Dev.	Range
Mon. Pts	479-7182	3849	0.007	0.004	0.017	0.009	0.008	-0.038 to +0.033
CGPS	9397-35383	19436	0.007	0.005	0.016	0.007	0.005	-0.017 to +0.016

Local Accuracy: The relative accuracy of points resulting from the minimally constrained Adjustment #1 is estimated at the 95% Level of Confidence in feet.

Average	Monitoring Points		CGPS Stations	
	2D	Vertical	2D	Vertical
	0.013	0.029	0.006	0.007

Movement Accuracy: The relative movements reported between October 5, 2016 and October 4, 2017 (12.0 months) statistically attained an average accuracy of 0.016 feet at the 95% Level of Confidence and range 0.006 to 0.024 feet. The actual accuracy of measurements held to the “one-centimeter standard” are estimated to approach 0.01 feet as demonstrated by the vector residuals, repeatability of measurements at points considered stable, and deflection analysis. Refer to the sections titled ACCURACY and QAQC ANALYSIS in this Report for more information.

Statistically, the probability at the 95% level of confidence is that movement (signal) has occurred at a point when the horizontal distance between two epochs is greater than the 95% Error (noise). No movement is considered detected unless the movement exceeds the 95% Error for individual points. Applying this criterion, 5 points have not moved. See the attached “PB MOVEMENT DATA POSTING 2007-2017.10.xlsx” for the relative movements and the estimated error at the 95% Level of Confidence for individual points.

NAVD88 Heights: The North American Vertical Datum of 1988 orthometric heights resulting from Adjustment #2 are derived from the difference in ellipsoid heights combined with the Geoid03 Model and constrained to the NAVD88 height of PVE3 determined in 2007 based on the second order orthometric height of VTIS. The relative accuracy of the heights is expected to be 0.03 feet or better, but can be greater at obstructed sites. The absolute accuracy of the heights relative to the datum is dependent on the published orthometric height on the CGPS Station VTIS. Up until October 2011 there were no specific requirements for vertical accuracies. In October 2011, a 0.03-foot relative vertical accuracy preference was introduced for points AB17, AB57, CR07, CR50 and CR51. In the September 2012 and subsequent surveys the preference was extended to all points.

QUALITY CONTROL - QUALITY ASSURANCE (QAQC) ANALYSIS

To ensure the accuracy and validity of the measurement systems used in these GNSS monitoring surveys, an independent test was conducted in 2007 using conventional terrestrial based instruments as reported in the "QAQC ANALYSIS" section of the September 2007 Monitoring Survey Report. Comparing the results of the GNSS systems with conventional instrumentation found horizontal measurements agreed 0.01 feet on average. In November 2011, the GNSS instruments and fixed height poles used in this survey were calibrated on the National Geodetic Survey's Santa Maria Baseline and found to agree with published distances 0.003 to 0.006 feet. In February 2018, the GNSS instruments and fixed height poles were calibrated on the NGS Camarillo Baseline and found to agree with published distances 0.003 feet.

To validate the radial survey method used in these surveys to position points from base stations AB61, independent GNSS intra-net cross connections were measured and compared with the stand alone computed inverse distances in the 2007, 2008 and 2009 surveys. The results found the two-dimensional accuracy to agree 0.01 feet on average, indicating the radial method of measurements is reliable and the additional labor cost of measuring cross connection between points is not warranted. See the "QAQC ANALYSIS" section of the September 2007 and the December 2008 Monitoring Survey Reports for detailed analysis.

Deflection Analysis is a method established by this surveyor to assess the consistency of the direction of movements reported from period to period. Assuming that movements are generally linear for points moving less than a foot, the separation or the deflection between the direction of the previous and present periods taken over the moved distance implies the accuracy obtained with the equipment, methods and procedures. Analysis of individual deflections found the separations and implied accuracy varied 0.01 to 0.02 feet.

SUMMARY

Point movement ranges by slide zones are listed below in feet:

(AB##) 0.00 to 0.29
(CR##) 0.00 to 0.13
(FT##) 0.04 to 0.29
(KC##) 0.00 to 0.25
(PB##) 0.19 to 2.43 and 12.44 at PB67
(UB02) 2.78

See the Appendix for a graphic of the horizontal movements depicted by 1" and 1' contours.

See the attached " PB MOVEMENT DATA POSTING 2007-2017.10.xlsx " spreadsheet for overall and periodic movements of each point. The movements are given in north, east and up or down as well as a vector of distance and direction relative to north. The direction is given as an azimuth in degrees where 0° is north and increases clockwise (90° East, 180° South, 270° West). The overall movements listed in the spreadsheet are from the date when a point was first set to the present survey.

The present status of monitored points is provided in the Appendix under "Monitoring Point Status". The historical status of all monitoring points is provided in the September 2007 Survey Report. The historical 1994-2006 positions of all points are listed in the Charles Abbott Associates Inc. file "ALL POINTS MOST RECENT OBSERVED POSITION AS OF SEPTEMBER 15, 2006.xls". This file was attached as an electronic file to the 2007 Survey Report.

RECOMMENDATION

An ongoing re-location program for monuments has long term benefits resulting in better accuracy and lower cost surveys due to improved sky visibility for tracking satellites. No monuments were re-located during this survey. Points AB16, AB17, AB24 and AB58 have limited sky visibility and are candidates for re-location or deletion. AB12 is in a horse corral and is difficult to access; however, there are no nearby alternatives.

Two points could be substantially improved by tree trimming along public roads where there are no adjacent residences by trimming the Pepper Trees northeast and southwest of AB17 on Fruit Tree Road and northeast of AB58 on Narcissa Drive.

Attachments: The following document is attached to this Report. "PB MOVEMENT DATA POSTING 2007-2017.10.xlsx" listing the coordinates of the initial positions, the overall and periodic movements of monitoring points since 2007.

SURVEYOR'S STATEMENT

This is a Report on the procedures, criteria and results of the City of Rancho Palos Verdes Portuguese Bend Landslide Monitoring Surveys. This Report includes the Initial Survey conducted in the fall, the Second Survey Addendum No.1 added in the winter and the Third Survey Addendum No.2 added in the spring. This survey was conducted and the report prepared by me at the request of Ron Drago, Principal Engineer of the City of Rancho Palos Verdes.

Initial Survey - Full Monitoring Signature

 12/5/17
Michael R. McGee P.L.S. 3945 Date

Second Survey - Partial Monitoring Signature

 3/23/18
Michael R. McGee P.L.S. 3945 Date

Third Survey - Partial Monitoring Signature

 4/23/18
Michael R. McGee P.L.S. 3945 Date

APPENDIX

McGEE SURVEYING CONSULTING
5290 Overpass Road, Ste#107, Santa Barbara, CA 93111

MCGEE SURVEYING CONSULTING							
RANCHO PALOS VERDES - PORTUGUESE LAND SLIDE MONITORING POINT STATUS Prepared 12/04/2017							
Notes:	180+/- Monitoring Points established since 1994 through 2016						
09/01/07	71 Points Surveyed 60 old points found with 52 monitored plus 19 new points						
12/01/08	67 Points Surveyed AB09, KC11, PB51 discontinued; BB53 destroyed; AB05 disturbed						
11/01/09	68 Points Surveyed Set PB64 to replace PB63 destroyed subsequently						
10/01/10	65 Points Surveyed Discontinued AB03, BB25; set PB65 to replace PB62 destroyed by paving						
10/03/11	69 Points Surveyed; Set AB62 & AB63 to replace AB06 & AB07						
09/14/12	72 Points Surveyed; Discontinued AB06, AB07; AB55 destroyed by trenching; Added 8 new points						
10/06/13	65 Points Surveyed; Discontinued AB15, AB18, AB52, AB54, CR52, KC04, PB53						
09/19/14	64 Points Surveyed; Discontinued BB52, PB67 set in April 2014; Added PVE3RP (reference to PVE3 antenna)						
10/08/15	66 Points Surveyed; AB56 Destroyed & Replaced by AB71A; PB68, PB69, & PB70 Set in April 2015						
10/05/16	66 Points Surveyed; AB71A Destroyed & Replaced by AB71;						
10/04/17	66 Points Surveyed; 30 Points to Survey in Feb 2018 and April 2018

Addendum No. 1

Monitoring Survey No. 20 Report Portuguese Bend Landslide Monitoring February 12, 2018 Partial Monitoring Survey for the City of Rancho Palos Verdes by McGee Surveying Consulting

Overview:

This Addendum No. 1 Report describes the February 12, 2018 (average date) tri-annual Portuguese Bend Monitoring Survey. This partial survey included 30 points which are a sub-set of the full monitoring set reported above. AB13 was substituted for AB12 due to access issues on private land used as a horse corral with guard dogs. Reviewing the movements of AB12 and AB13 over the last 10 years finds the movements are consistent in direction, and the distance at AB12 is generally about equal or up to 1/3 greater than at AB13. It is recommended AB13 be substituted for AB12 and that AB12 be monitored once a year during the primary fall survey.

This survey followed the procedures described in previous surveys. For a detailed history of the program and surveys see "History" above and Monitoring Survey Reports by this surveyor dating back to 2007. The field survey took place February 11-13, 2018. The Field Surveys, Equipment, Data Collection and Network Design were as described in the above Report. Four continuously operating GPS stations (CGPS) were connected to this survey with three 4-8 hour observations.

The movements reported between October 4, 2017 and February 12, 2018 (4.3 months) statistically attained an average accuracy of 0.019 feet at the 95% Level of Confidence. The vectors residuals follow: the 2D averaged 0.007' with a maximum of 0.021' and the vertical averaged 0.011' with a maximum of 0.075'.

A Minimally Constrained Adjustment was processed to develop NAD83 (2007) 2007.00 Epoch Geodetic and State Plane Coordinates in feet. CGPS Station PVE3 was fixed and the differences in north, east and up from the 10/04/2017 survey to the 02/12/2018 survey are listed in feet below.

10/04/2017 to 02/12/2018			
Station	dN	dE	dZ

The differences from the original 2007 positions below

PVRS	-0.024	0.018	-0.013
VTIS	0.002	0.013	-0.026

As a standard procedure the adjustment was constrained to the CGPS station PVE3 and finds no difference, within the accuracy of the measurement system, in the positions of the primary base station AB61 and the positions of the CGPS stations PVRS and VTIS. The CGPS stations and KC16 are known to be stable over time and indicate the survey reference frame was stable and successfully recovered.

The Movement Distances and Elevation Changes are summarized in the **“Periodic Horizontal & Vertical Movement in Feet”** below.

Addendum No. 2

Monitoring Survey No. 21 Report Portuguese Bend Landslide Monitoring April 16, 2018 Partial Monitoring Survey for the City of Rancho Palos Verdes by McGee Surveying Consulting

Overview:

This Addendum No. 2 Report describes the April 16, 2018 (average date) tri-annual Portuguese Bend Monitoring Survey. This partial survey included 30 points which are a sub-set of the full monitoring set reported above.

This survey followed the procedures described in previous surveys. For a detailed history of the program and surveys see "History" above and Monitoring Survey Reports by this surveyor dating back to 2007. The field survey took place April 15-17, 2018. The Field Surveys, Equipment, Data Collection and Network Design were as described in the above Report. Four continuously operating GPS stations (CGPS) were connected to this survey with three 5-8 hour observations.

The movements reported between February 12, 2018 and April 16, 2018 (1.6 months) statistically attained an average accuracy of 0.02 feet at the 95% Level of Confidence. The vectors residuals follow: the 2D averaged 0.005' with a maximum of 0.016' and the vertical averaged 0.009' with a maximum of 0.031'.

A Minimally Constrained Adjustment was processed to develop NAD83 (2007) 2007.00 Epoch Geodetic and State Plane Coordinates in feet. CGPS Station PVE3 was fixed and the differences in north, east and up from the 02/12/2018 survey to the 04/16/2018 survey are listed in feet below.

Note: The measurement confidence is 0.02' (1/4"); therefore, movements greater than 0.02' are deemed to have actually moved. See "PB MOVEMENT DATA POSTING 2007-(Present).xlsx" for details.

Survey Report

of the

Portuguese Bend Landslide Monitoring Surveys

Dated: January 30, 2017, Appended March 15 and July 6, 2017

for the

City of Rancho Palos Verdes

prepared by

McGee Surveying Consulting

The Portuguese Bend Landslide is monitored on a tri-annual basis beginning with the rainy season. The initial survey of 66 monuments is conducted in the in September-October and reported herein. Two subsequent partial monitoring surveys of about 30 monuments are conducted in mid-winter and mid- spring. The second and third surveys are reported as Addendums No. 1 and No. 2 to this Report. Therefore, this Report is issued three times a year with the third being the final for the rainy season. The average date of each survey follows.

Initial Survey - October 5, 2016 Full Monitoring Survey No. 16 Report

Second Survey - February 24, 2017 Partial Monitoring Survey No. 17 Report

Third Survey – May 03, 2017 Partial Monitoring Survey No. 18

Survey Report
of the
Portuguese Bend Landslide Monitoring Survey
October 5, 2016 Primary Monitoring
for the
City of Rancho Palos Verdes
prepared by
McGee Surveying Consulting
January 30, 2017

PROJECT OVERVIEW:

McGee Surveying Consulting performed a landslide monitoring survey in October 2016 at Portuguese Bend on behalf of the City of Rancho Palos Verdes. This survey established positions on monitoring points to determine overall and periodic movements. The results of the survey are described in this Report and in the attached spreadsheet titled "[PB MOVEMENT DATA POSTING 2007-2016.10.xlsx](#)". Two partial monitoring surveys are performed in the winter and spring and reported as addendums to this Report.

The field survey was planned, coordinated and executed by Michael McGee, PLS3945 of McGee Surveying Consulting who was also responsible for the final processing of the observations, network adjustments, analysis and reports. The monitoring points cover a 1½ mile square area and are measured to determine the rate and extent of ground movement. The area has been monitored by the City of Rancho Palos Verdes circa 1994 having been taken over from the County of Los Angeles. The Global Navigation Satellite System (GNSS (formerly referred to as GPS)) technology is used to measure positions based on the North American Datum of 1983 (NAD83) and the North American Vertical Datum of 1988 (NAVD 88). This survey is referenced to California CGPS (Continuous GPS) Stations in the region which are permanently mounted GPS and GNSS receivers used for monitoring seismic activity. The CGPS in California are similar to the national CORS (Continuously Operated Reference Stations).

Points that move a few inches or less per year are required to meet an accuracy standard of one centimeter (0.033 feet) at the 95% Level of Confidence. In the active slide area where the movements are greater than 0.25 feet per year (PB and UB points), the accuracy standard is two centimeters (0.066 feet) at the 95% Level of Confidence. Field procedures are designed to accomplish this purpose and Quality Control-Quality Assurance (QAQC) processes discussed hereafter are incorporated to verify these accuracies are attained.

Prior to September 2007, successive coordinate differences were used to compute movements; however, arithmetic differences do not provide statistical information about the relative movement accuracies. Beginning with the initial 2007 survey, field and office procedures were designed to assure the accuracy and reliability of measurements and provide for queries between epochs that include statistical information about the relative precisions of the reported movements. Measurements of temporal movements are based on a rigorous simultaneous least squares adjustment of multiple observations at two different epochs for each point.

HISTORY

This monitoring survey is a continuation of a program initiated by the County of Los Angeles and taken over by the City of Rancho Palos Verdes circa 1994. McGee Surveying Consulting has conducted the field surveys and reporting since September 2007. The monitoring surveys have occurred annually since 2007, semi-annually since 2012 and three times a year beginning with the September 2014 survey. See the September 2007 Survey Report for a history of the previous survey process between 1994 and 2007. See the Survey Reports on file with the City after 2006 for details of each monitoring campaign.

PROJECT DATUMS, REFERENCE SYSTEM

Horizontal Datum: North American Datum of 1983 established by the National Geodetic Survey (NGS) referred to as NAD83 (2007) 2007.00 Epoch. The NAD83 (2007) 2007.00 Epoch adjustment is one of a series of national adjustments of NAD83 since its adoption in 1986 and is the realization used for these monitoring surveys since 2007. The latest realization of NAD83 is the 2011 adjustment referred to as NAD83 (2011) 2010.00 Epoch; however, the above referenced 2007 realization is retained to be consistent with prior reporting and the primary purpose of determining relative movements over time.

Reference Network: The survey is referenced to the CGPS Stations (continuously operating GNSS receivers). For more information see NGS Data Sheets for the PID's listed below (no data sheet exists for PVE3). The positions listed below were obtained in September 2007 from the California Spatial Reference Center (CSRC). The CSRC provides CA Public Resources Code sanctioned positions for the California CGPS Stations.

Units: Feet

CGPS	Latitude (dms)	Longitude (dms)	EH (feet)	NGS PID	NAME
PVE3	33 44 35.853290	-118 24 15.269036	235.42	none	PALOS VERDES CORS
PVHS	33 46 46.020150	-118 22 19.741258	853.99	AJ1915	PENINSULA HIGH SCH
PVRS**	33 46 25.891904	-118 19 14.067218	198.63	AJ1916	PALOS VERDES RES
VTIS	33 42 45.489584	-118 17 37.712290	197.52	AJ1936	MARINE EXCHANGE

** Falls in the proximity of a Fault Line as shown below but appears unaffected to date

CGPS Stations (north up)

Vertical Datum: North American Vertical Datum of 1988 (NAVD88) established by the NGS.

Reference Network: CGPS Station VTIS is also a Second Order leveled benchmark and the original basis for the elevations in this survey. See the Record Elevations of CGPS stations following.

CGPS	NAVD88 Ht (feet)	
PVE3	none	
PVHS	972.1	Based on a Refined Geoid Model
PVRS	316.37	Based on Second Order Leveling by CSRC
VTIS	315.26	Based on Second Order Leveling by CSRC and basis for this survey

Geoid Model: Geoid 03: Note Geoid09 became available from the NGS in 2009 and Geoid12A in 2012; however, Geoid03 is retained to be consistent with prior reported heights and the primary purpose of determining relative height changes over time.

Projection: Plane coordinates are NAD83 California State Plane Coordinates Zone 5 in US Feet: The State Plane Coordinate Parameters follow: The average Scale Factor is 1.00007543, the Height Reduction Factor based on the average ellipsoid heights is 0.99999092, and the average Combined Grid Factor is 1.00006635. Distances in this survey are grid. To obtain ground distances divide grid distances by the Combined Grid Factor. Grid bearings resulting from this survey must be rotated by a Convergence Angle to obtain geodetic (true) bearings. The average convergence angle is -0-12-30± (rotate left 0-12-30).

Datum Stability: Rancho Palos Verdes sits on the Pacific Plate which is moving west-northwesterly relative to the North American Plate about 4 centimeters (0.14 feet) per year. The area southwesterly of the Fault Line shown on the above map includes the City and is moving at a constant rate as exhibited by the International Terrestrial Reference Frame (ITRF) north, east and up velocities of the CGPS Stations listed below. Note, there was no change.

SITE	ANNUAL VELOCITIES/METERS			ANALYSIS PERIOD	
	N	E	Up	START DATE	END DATE
PVE3	0.019	-0.039	-0.000	2000.7312	2017.0151
PVHS	0.019	-0.040	0.001	1999.5112	2017.0151
PVRS	0.019	-0.039	0.000	1999.0946	2017.0151
VTIS	0.019	-0.039	-0.001	1998.9380	2016.8105

These CGPS Stations provide a rigid reference frame for the Portuguese Landslide Monitoring Program that is validated during each monitoring campaign. See the Adjustments results below and the September 2007 Monitoring Survey Report by McGee Surveying Consulting for additional information.

FIELD SURVEYS, DATA COLLECTION, EQUIPMENT & PROCESSING

Three Leica geodetic GNSS receivers/antennas listed below were mounted on two-meter fixed height poles or tripod/tribrach to collect satellite signal data. The GS15 receivers tracked Navstar GPS, GLONASS and BeiDou satellites. Prior to initiating the field observations, a calibration of the poles and tribrach was conducted to verify their heights and plumb. The poles were found to be plumb within 0.003 feet consistent with prior years. There were no equipment failures.

Sixty-six monitoring points were occupied and reported in this survey. Site photographs and recovery sheets detailing the location, character of the monuments and obstructions were maintained and updated. See the Appendix for "Monitoring Point Status". Monument AB61, established in September 2007 on Portuguese Point, is used as the primary base station in each survey because it sits above a stable basalt formation. AB20 serves as a secondary base during each survey.

The field survey commenced each day by setting a Leica GS15 GNSS receiver on a fixed height pole at AB61 and on a tribrach/tripod at AB20 while a third GS15 GNSS receiver roamed freely collecting observations on a fixed height pole at the remaining 64 points. Points with annual movements less than 0.25' were measured with two or more independent occupations resulting in a minimum of four vectors to each point from AB61 and AB20. An independent occupation means the points were occupied under a different constellation of satellites usually on a different day. If the two measurements are within 0.03 feet (1 cm) horizontally, they are accepted, otherwise a third measurement is required. AB61, AB20 and the CGPS stations were connected with 8 hour (average) observations collected over a six-day period. Nineteen points in the active areas with annual

movements greater than 0.25' were single occupied. AB12 was single occupied due to restricted access. A comparison with the linear movements from prior years was made to verify their accuracy.

Many of the points are over-shadowed by mature trees and shrubberies which interfere with signals received from satellites and affect the quality of measurements. To obtain the best possible accuracies, the satellite constellation is compared with obstruction diagrams to estimate the best time for observing un-obstructed satellites. To improve the accuracy of the measurements, satellites that are obstructed by foliage and trees are either turned off during the observation or noted for removal in post-processing. If six or more un-obstructed satellites with a GDOP of less than three (measure of the geometry or strength of figure of the constellation) are available, then the measurement commences for a minimum of 15 minutes of data collection. If the geometry and number of satellites are insufficient then the receiver is moved to another point and returned later when satellite availability improves.

Date of Survey: 09/27-28/2016 and 10/9-12/16 (mean date 10/05/2016) between 0600-1800 PDST (+7 hrs for UTC).

GNSS Survey Parameters:

Constellation: 30 US NAVSTAR GPS satellites and 24 Russian GLONASS satellites.

Observables: GPS L1 & L2 and GLONASS L1 & L2 Carrier Waves

Epoch Rate - Occupation Times: 15 second epoch rate - 15 minute occupations at monitoring points and six 8 hour occupations at base stations.

Satellites: 11-18; GDOP =< 2; Elevation Mask for Data Collection at 15° and Processing at 15°

Ephemeris: Rapid for Static Post-Processing of CGPS connections and Broadcast for onsite.

Weather: A mixture of clear and cloudy skies with marine layer on the last two days, temperature 70°-85° F, no significant weather.

Space Weather: Boulder K Index (gauges ionospheric activity on a scale of 0-9; prefer less than 5 to avoid noisy data) was 4-6 on 09/27-28/2016. When the K factor reached 6 the survey was suspended until 10/09-12/2016 when it ranged 0-3.

Equipment:

GNSS Base Receiver Unit No.: M8, Operator: M. McGee, PLS; Station Occupied: AB61 (Base1)

Make & Model: Leica GS15; Antenna Leica GS15; Mount: Fixed Height Pole #1; Antenna Height: 1.803m

GNSS Rover Receiver Unit No.: M9, Operator: M. McGee, PLS;

Make & Model: Leica GS15; Antenna Leica GS15; Mount: Fixed Height Pole #3; Antenna Height: 1.800m

GNSS Rover Receiver Unit No.: M7, Operator: M. McGee, PLS, Station Occupied: AB20 (Base2)

Make & Model: Leica GS15; Antenna Leica GS15; Mount: Tribach on Tripod; Antenna Height: varies

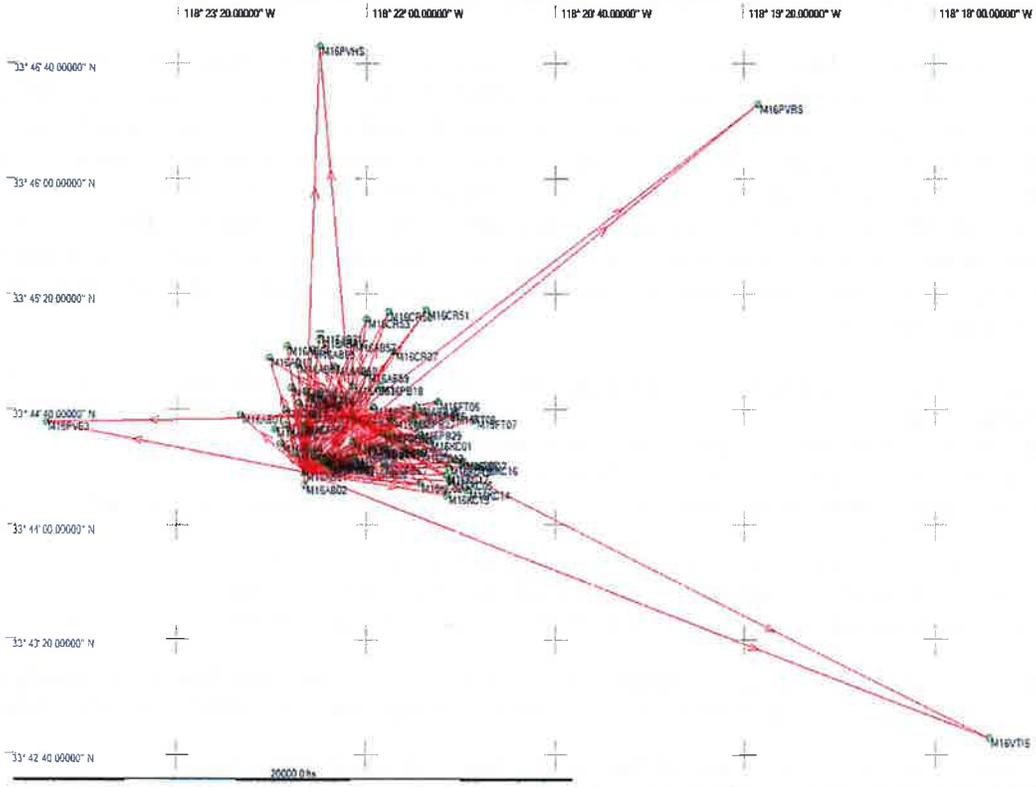

Vectors were processed using Leica LGO v8.4 post processing software. Analysis of residuals led to the rejection of 3 out of 48 vectors connecting the CGPS Stations to AB61 and AB20, and 0 out of 222 vectors connecting monitoring points. Network adjustments and analysis were performed with "Starnet-PRO" version 8.2.3 software. Rinex files of the satellite measurements for the CGPS Stations were downloaded from the SOPAC website. The Rapid Ephemeris and Absolute Antenna Models were obtained from the NGS website.

NETWORK

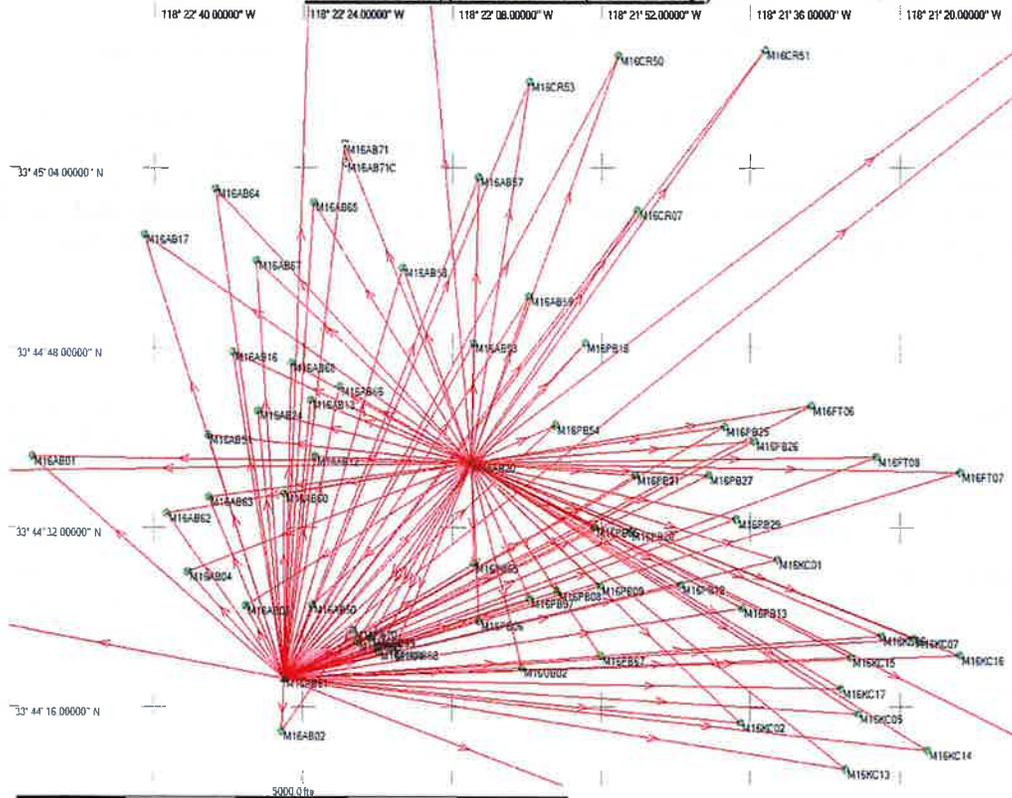

The primary Base Station is AB61, which sits on Portuguese Point, is the focal point of the static network connecting the monitoring points and CGPS Stations. AB20, a second Base Station is centrally located sitting on top of a high bluff overlooking Portuguese Bend. Sixty-six points and four CGPS Stations were connected with 270 vectors. See the following Network Maps and the Aerial View in the Appendix.

The monitoring plan utilizes the CGPS Stations to verify the stability of the reference frame. The primary CGPS Station used to control this survey is PVE3 located just south of City Hall and 1.8 miles west-northwest of Base Station AB61. CGPS Stations PVHS, PVR5 and VTIS are used to validate the stability of the network.

Monitoring Network and CGPS Stations (north up)

Monitoring Network (north up)

MONITORING POINT HISTORY and STATUS

This is the 16th Monitoring Survey. For data management purposes during the field survey and data processing, the point names are prefixed with the sequential number to distinguish between monitoring surveys. For example, on the 16th monitoring survey, AB61 was named M16AB61 where M16 indicates the sequence number since the initial September 2007 Monitoring Survey. The prefix is stripped in the "COORDINATES LIST" and "PB MOVEMENT DATA POSTING 2007-2016.10.xlsx".

Between 1994 and 2006, 149 monitoring points were established to monitor the Portuguese Bend Landslides, many of which were lost or destroyed. Sixty of the original points were recovered in 2007. Eight of the 60 points were deleted because they were in close proximity of other points better suited for GNSS satellite measurements leaving 52 points monitored and reported between September 2006 and September 2007. Three of the 52 points (AB09, KC11 & PB51) were monitored in September 2007 for the last time and replaced by new points, set nearby and better suited for satellite observations.

2007: Eighteen new points were set in 2007 and had their movements reported for the first time in the following December 2008 survey. In September, it was noted that KC01 was previously reported by others on 9/14/2006 to have moved N 29°E 1.24' from its 12/9/2005 position. In the September 2008 survey, a buried partially illegible brass cap in concrete stamped "COUNTY ENGINEER RE8869 1956 STA ??IELDS" was found S31°29'W 1.48 feet from the 1" IP used by the previous survey and this survey in the initial September 2007 and subsequent surveys. The original 1994 position of KC01 was re-referenced to the 1" IP, resulting in correct overall reported movements.

2008: In December 2008, 49 original and 18 new points were surveyed for a total of 67 monitoring points. In December, it was noted that AB05 had been disturbed by a mowing machine. AB05 was found chipped and leaning to southerly about 0.4'. The movement reporting resumed in 2009. Analysis of the movement and historic data made it possible to estimate the disturbance to within 0.05'. The original 1995 position of AB05 was re-referenced S14°02'E 0.29' to be consistent with the disturbed position, resulting in correct overall reported movements.

2009: PB64 was set east of the Archery Range to replace PB63 (set 2007) which had become unsafe to access and was lost in 2010. PB64 was reported for the first time in October 2010.

2010: Points AB03 and BB25 were discontinued. AB03 is on the edge of a cliff 192 feet west-southwest of AB61 making it redundant, and BB25 is on a freestanding rock susceptible to disturbance by wave action. In the summer of 2010, PB62 was destroyed by road construction and in October 2010, PB65 was set 24' south-southwest of PB62's location and reported for the first time in October 2011. The following points may have been disturbed prior to the October 2010 survey. AB05 appears to have been disturbed by mower machinery, AB15 (½" GIP in a meter box) is driven over by vehicles occasionally accessing an adjacent field, and KC02 (½" GIP in a meter box) is occasionally parked on by vehicles accessing the beach.

2011: In October, new points AB62 and AB63 (initially referred to as AB62R and AB63R) were set to replace AB06 and AB07 which were hazardous to occupy due to their location near the traveled way of Palos Verde Drive South.

2012: In September, prior to initiating the survey, eight new monuments AB64, AB65, AB66, AB67, AB68, CR53, KC17 and PB66 were constructed to replace AB54, AB18, AB52, AB55, AB15, CR52, KC04 and PB53 respectively. The monuments were replaced because of poor sky visibility except for KC04 which was difficult to access and AB55 which was destroyed by trenching in the past year. Monuments were set with the following design. Monuments set in soil are 1" x 5' GIP driven flush and encase in a 6" PVC pipe sitting on a concrete collar down about 18". Monuments set in asphalt are 1/2" x 2' rebar driven below the surface inside a free floating 2" concrete encased plastic collar.

2013: Points AB15, AB18, AB52, AB54, CR52, KC04 and PB53 were surveyed for the last time in 2012 and discontinued. BB52 is on a freestanding rock susceptible to disturbance by wave action and was monitored for the last time in October and discontinued.

2014: In April PB64 was monitored for the last time due to unsafe access conditions and PB67 (a 5' t-bar steel post driven 3' into the ground) was set NNW'ly about 250' as a replacement and reported for the first time in September 2014 after 4.5 months whereas all other points in the "PB MOVEMENT DATA POSTING 2007-

2016.10.xlsx" are reported for 11.5 months since October 2013. In September, AB69 located about 260' NE of AB12 and AB70 located about 140' SE of AB12 were set as potential replacements; however, AB69 was destroyed by lot improvements and AB70 proved to be too obstructed for accurate results.

2015: In April, new points PB68, PB69 and PB70 were set to monitor movements of "Palos Verdes Drive South" and reported in October. In October, Monitoring Point AB56 was found disturbed by construction and AB71 (magnetic nail in AC) was set as a temporary replacement. In October, the steel post for PB67 was not found. An inconspicuous 1/2" x 4' rebar was set flush in its place. Because of the large movement in this area a more permanent monument is not necessary.

2016: In October, the temporary point for AB71 was destroyed by road work prior to this survey. AB71 was reset 12' easterly with a 2" screw and brass washer drilled into a granite curb on Vanderlip Road. No movement information will be available until the fall 2017. KC16 was raised to the surface of the road by others between the two occupations by this survey. Estimated height changed +0.33' +/-.

See the "Monitoring Point Status" in the Appendix for the present status of monitoring points.

ADJUSTMENTS & ANALYSIS

Adjustment 1: An adjustment to develop NAD83 (2007) 2007.00 Epoch Geodetic, Ellipsoid and State Plane Coordinates. CGPS Station PVE3 was fixed at its published NAD83 (2007) 2007.00 Epoch position listed above in a Minimally Constrained Adjustment to determine positions of points in this survey and verify its stability relative to other CGPS stations. PVE3 is located 1.8 miles westerly of and outside the influence of the slide area. PVE3 has been fixed in all adjustments since 2007. The CSRC publishes a Time Series representing the horizontal and vertical stability of PVE3 which indicate the position is stable. The primary base station AB61 and three other operating CGPS Stations were measured relative to PVE3 and used to assess stability of the survey reference frame. The positions are based on 8 hour (average) observations for six days. Differences in feet from one monitoring survey to another for key points are listed in the table below.

10/2013 Positions to 09/2014					9/2007 Positions to 09/2014

KC16	-0.022	0.001	-----		KC16	-0.009	-0.003	-----

Comments: The Base Station AB61 has no significant difference since October 2015 and 2007 as referenced to PVE3. Given that PVE3 and AB61 are in agreement, the survey reference frame is deemed stable and successfully recovered. An adjustment constrained to the other CGPS Stations is not necessary because the purpose here is to track their movements over time to test the stability of the reference frame and validate the measured movements. See the “COORDINATE LIST” in the Appendix for a list of coordinates resulting from this adjustment. See prior Survey Reports for coordinates resulting from earlier surveys.

Adjustment 2: An adjustment to develop NAVD88 Orthometric Heights (Elevations). The CGPS Station PVE3 was fixed horizontally and vertically at its NAVD88 height determined in the September 2007 survey. The 2007 height was based on the published 2nd Order NAVD88 Height of CGPS Station VTIS. This Adjustment combines the measured ellipsoid height differences with the NGS Geoid03 Model (models the separation between the ellipsoid and geoid surfaces) to determine the NAVD88 orthometric heights of the CGPS Stations and monitoring points.

ACCURACY

This survey conform to the intent of the California Spatial Reference Center & California Lands Surveyors Association’s “GNSS Surveying Standards and Specifications, 1.1” (2014) and the Federal Geodetic Control Subcommittee (FGCS) “Specifications for GPS Relative Positioning” (1988).

Vector Residuals: The vector lengths, two dimensional residuals and the absolute value of the vertical residuals resulting from minimally constrained Adjustment #1 are listed below in feet. Three vectors to CGPS Stations were removed due to large residuals. Forty vectors to single occupied monitoring points are not included because they have no independent residuals and would optimistically skew the results. The statistics given below are applicable for all points.

Network	Vector Lengths		Two Dimensional Residuals			Vertical Residuals (absolute)		
	Vary	Average	Average	Std.Dev.	Maximum	Average	Std.Dev.	Range
Mon. Pts	479-7182	3171	0.007	0.005	0.037	0.012	0.010	-0.058 to +0.036
CGPS Sta's	9397-26102	17525	0.006	0.003	0.014	0.012	0.009	-0.035 to +0.032

Local Accuracy: The relative accuracy of vectors resulting from the minimally constrained Adjustment #1 is estimated at the 95% Level of Confidence in feet.

	Monitoring Points		CGPS Stations	
	2D	Vertical	2D	Vertical
Average	0.010	0.021	0.004	0.005
Maximum	0.018	0.046	0.004	0.007

Network Accuracy: The network accuracy of the coordinates derived from Adjustment #1 relative to the NAD83 Datum fixed at the CGPS Station PVE3 are estimated at the 95% Level of Confidence in feet.

	Monitoring Points		CGPS Stations	
	2D	Vertical	2D	Vertical
Average	0.010	0.022	0.004	0.005
Maximum	0.019	0.046	0.005	0.008

At the 95% confidence level, the average coordinate has a horizontal radius of circular error is 0.010 feet and a vertical of 0.022 feet with a max of 0.019 and 0.046 feet respectively.

Movement Accuracy: The relative movements reported between October 8, 2015 and October 5, 2016 (12.0 months) statistically attained an average accuracy of 0.014 feet at the 95% Level of Confidence and range 0.005 to 0.020 feet. The actual accuracy of measurements held to the “one-centimeter standard” are estimated to approach 0.01 feet as demonstrated by the vector residuals, repeatability of measurements at points considered stable, and deflection analysis. Refer to the sections titled ACCURACY and QAQC ANALYSIS in this Report for more information.

Statistically, the probability at the 95% level of confidence is that movement (signal) has occurred at a point when the horizontal distance between two epochs is greater than the 95% Error (noise). No movement is considered detected unless the movement exceeds the 95% Error for individual points. Applying this criterion, 6 points have not moved. See the attached "PB MOVEMENT DATA POSTING 2007-2016.10.xlsx" for the relative movements and the estimated error at the 95% Level of Confidence for individual points.

NAVD88 Heights: The North American Vertical Datum of 1988 orthometric heights resulting from Adjustment #2 are derived from the difference in ellipsoid heights combined with the Geoid03 Model and constrained to the NAVD88 height of PVE3 determined in 2007. The relative accuracy of the heights is expected to be 0.03 feet or better, but can be greater at obstructed sites. The absolute accuracy of the heights relative to the datum is dependent on the published orthometric height on the CGPS Station VTIS. Up until October 2011 there were no specific requirements for vertical accuracies. In October 2011, a 0.03-foot relative vertical accuracy preference was introduced for points AB17, AB57, CR07, CR50 and CR51. In the September 2012 and subsequent surveys the preference was extended to all points.

QUALITY CONTROL - QUALITY ASSURANCE (QAQC) ANALYSIS

To ensure the accuracy and validity of the measurement systems used in these GNSS monitoring surveys, an independent test was conducted in 2007 using conventional terrestrial based instruments as reported in the "QAQC ANALYSIS" section of the September 2007 Monitoring Survey Report. Comparing the results of the GNSS systems with conventional instrumentation found horizontal measurements agreed 0.01 feet on average. In November of 2011 the GNSS instruments and fixed height poles used in this survey were calibrated on the Santa Maria National Geodetic Survey Baseline and found to agree with published distances 0.003 to 0.006 feet.

To validate the radial survey method used in these surveys to position points from base stations AB61 and AB20, independent GNSS cross connections were measured and compared with the stand alone computed inverse distances in the 2007, 2008 and 2009 surveys. The results found the two dimensional accuracy to agree 0.01 feet on average, indicating the radial method of measurements is reliable and the additional labor cost of measuring cross connection between points is not warranted. See the "QAQC ANALYSIS" section of the September 2007 and the December 2008 Monitoring Survey Reports for detailed analysis.

Deflection Analysis is a method established by this surveyor to assess the consistency of the direction of movements reported from period to period. Assuming that movements are generally linear for points moving less than a foot, the separation or the deflection between the direction of the previous and present periods taken over the moved distance implies the accuracy obtained with the equipment, methods and procedures. Analysis of individual deflections found the separations and implied accuracy varied 0.01 to 0.02 feet.

SUMMARY

Point movement ranges by zones are listed below in feet:

(AB##) 0.00 to 0.06
(PB##) 0.04 to 1.60 and 9.73 at PB67
(KC##) 0.02 to 0.03
(CR##) 0.00 to 0.02
(FT##) 0.02 to 0.04
(KC##) 0.00 to 0.05

See the Appendix for a graphic of the horizontal movements depicted by zones ranging 0" to 1", 1" to 1' and 1' to 10'.

See the attached " PB MOVEMENT DATA POSTING 2007-2016.10.xlsx " spreadsheet for overall and periodic movements of each point. The movements are given in north, east and up or down as well as a vector of distance and direction relative to north. The direction is given as an azimuth in degrees where 0° is north and increases clockwise (90° East, 180° South, 270° West). The overall movements are from the date when a point was first set listed in the spreadsheet to the present survey.

The present status of monitored points is provided in the Appendix under "Monitoring Point Status". The historical status of all monitoring points is provided in the September 2007 Survey Report. The historical 1994-2006 positions of all points are listed in the Charles Abbott Associates Inc. file "ALL POINTS MOST RECENT OBSERVED POSITION AS OF SEPTEMBER 15, 2006.xls" attached as an electronic file to the 2007 Report.

RECOMMENDATION

An ongoing re-location program for monuments has long term benefits resulting in better accuracy and lower cost surveys due to improved sky visibility for tracking satellites. No monuments were re-located during this survey; however, Point AB56 was destroyed prior to the October 2015 monitoring and replaced. It was destroyed again prior to the October 2016 monitoring and replaced by AB71. Points AB16, AB17, AB24 and AB58 have limited sky visibility and are candidates for re-location or deletion. AB12 is in a horse corral and is difficult to access; however, there are no nearby alternatives.

Attachments: The following document is attached to this Report.
"PB MOVEMENT DATA POSTING 2007-2016.10.xlsx" listing the coordinates of the initial positions, the overall and periodic movements of monitoring points since 2007.

SURVEYOR'S STATEMENT

This is a Report on the procedures, criteria and results of the City of Rancho Palos Verdes Portuguese Bend Landslide Monitoring Surveys. This Report includes the Initial Monitoring Survey conducted in the fall and two Partial Monitoring Surveys added to the report as Addendum No.1 and Addendum No.2 in the following winter and spring. This survey was performed and the report prepared by me at the request of Ron Dragoo, Principal Engineer of the City of Rancho Palos Verdes.

Initial Monitoring Survey No. 16

MCGEE SURVEYING CONSULTING							
RANCHO PALOS VERDES - PORTUGUESE LAND SLIDE MONITORING POINT STATUS for 2017 Prepared 01/26/2017							
Notes:	162+ Monitoring Points established since 1994						
09/01/07	71 Points Surveyed 60 old points found with 52 monitored plus 19 new points						
12/01/08	67 Points Surveyed AB09, KC11, PB51 discontinued; BB53 destroyed; AB05 disturbed						
11/01/09	68 Points Surveyed Set PB64 to replace PB63 destroyed subsequently						
10/01/10	65 Points Surveyed Discontinued AB03, BB25; set PB65 to replace PB62 destroyed by paving						
10/03/11	69 Points Surveyed; Set AB62 & AB63 to replace AB06 & AB07						
09/14/12	72 Points Surveyed; Discontinued AB06, AB07; AB55 destroyed by trenching; Added 8 new points						
10/06/13	65 Points Surveyed; Discontinued AB15, AB18, AB52, AB54, CR52, KC04, PB53						
9/19/14	64 Points Surveyed; Discontinued BB52, PB67 set in April 2014; Added PVE3RP (reference to PVE3 antenna)						
10/08/15	66 Points Surveyed; AB56 Destroyed & Replaced by AB71A; PB68, PB69, & PB70 Set in April 2015						
10/05/16	66 Points Surveyed; AB71A Destroyed & Replaced by AB71;						
	30+/- Points to Survey in Feb 2017 and April 2017

Addendum No.1
Monitoring Survey No. 17 Report
Portuguese Bend Landslide Monitoring
February 24, 2017 Partial Monitoring Survey
 for the
City of Rancho Palos Verdes
 by
McGee Surveying Consulting
 March 14, 2017

Overview:

This Addendum No. 1 Report describes the February 2017 tri-annual Portuguese Bend Monitoring Survey. This partial survey included 30 points which are a sub-set of the full monitoring set.

This survey followed the procedures described in previous surveys. For a detailed history of the program and surveys see “History” above and previous Monitoring Survey Reports back to 2007. The field survey took place February 23-25, 2017. The Field Surveys, Equipment, Data Collection and Network Design were as described in the above Report. The survey included 30 onsite points, two of which were base stations AB61 and AB20 connecting each point with two to six vectors. An equipment issue occurred at the backup base AB20 resulting in a reliance on vectors from AB61 with good results. Four continuously operating GPS stations (CGPS) were connected to this survey with three 4-8 eight hours observations.

The movements reported between October 5, 2016 and February 24, 2017 (4.7 months) statistically attained an average accuracy of 0.019 feet at the 95% Level of Confidence. The overall vectors residuals follow: the 2D averaged 0.005’ with a maximum of 0.016’ and the vertical averaged 0.009’ with a maximum of 0.041’.

A Minimally Constrained Adjustment was processed to develop NAD83 (2007) 2007.00 Epoch Geodetic and State Plane Coordinates in feet. CGPS Station PVE3 was fixed and the differences are listed in feet from the October 5, 2016 to the February 24, 2017 positions below.

10/05/2016 to 02/24/2017

VTIS	-0.01	0.00	-0.03	CGPS Station

The adjustment, constrained to the CGPS station PVE3 as a standard procedure, finds no difference within the noise level of the measurement system in the horizontal position at the primary base station AB61 nor with CGPS stations PVHS, PVRS and VTIS as well as stations CR50 and KC16 considered to be fairly stable over time. The survey reference frame was deemed stable and successfully recovered. The results are compiled below.

Addendum No.2
Monitoring Survey No. 18 Report
Portuguese Bend Landslide Monitoring
May 3, 2017 Partial Monitoring Survey
for the
City of Rancho Palos Verdes
by
McGee Surveying Consulting
July 6, 2017

Overview:

This Addendum No. 2 Report describes the May 3, 2017 tri-annual Portuguese Bend Monitoring Survey. This partial survey included 29 points which are a sub-set of the full monitoring set.

This survey followed the procedures described in previous surveys. For a detailed history of the program and surveys see "History" above and previous Monitoring Survey Reports back to 2007. The field survey took place May 1-6, 2017. The Field Surveys, Equipment, Data Collection and Network Design were as described in the above Report. The survey included 29 onsite points, with a base station at AB61 connecting each point with one to three vectors. Access to FT07 was prevented due to hazardous conditions and will be resumed at the next monitoring. Four continuously operating GPS stations (CGPS) were connected to this survey with four 2-8 eight hours observations.

The movements reported between February 24, 2017 and May 3, 2017 (2.2 months) statistically attained an average accuracy of 0.019 feet at the 95% Level of Confidence. The overall vectors residuals follow: the 2D averaged 0.004' with a maximum of 0.013' and the vertical averaged 0.005' with a maximum of 0.027'.

A Minimally Constrained Adjustment was processed to develop NAD83 (2007) 2007.00 Epoch Geodetic and State Plane Coordinates in feet. CGPS Station PVE3 was fixed and the differences are listed in feet from the February 24, 2017 to the May 3, 2017 positions below.

Survey Report

of the

Portuguese Bend Landslide Monitoring Surveys

Dated: Feb. 3, 2016, Revised & Appended March 11, 2016, Appended April 22, 2016, Revised Aug. 9, 2016

for the

City of Rancho Palos Verdes

prepared by

McGee Surveying Consulting

The Portuguese Bend Landslide is monitored on a tri-annual basis beginning and ending with the rainy season. The initial survey of about 70 monuments is conducted in the early fall and reported below in detail. Two subsequent partial monitoring surveys of about 30 monuments are conducted in mid-winter and early spring. The second and third surveys are reported as Addendums No. 1 and No. 2 to this Report. Therefore, this Report is issued three times with the third being the final for the particular rainy season. The average date of the surveys follows.

Initial Survey - Full Monitoring: October 8, 2015

Second Survey - Partial Monitoring: February 16, 2016

Third Survey - Partial Monitoring: April 19, 2016

Survey Report
of the
Portuguese Bend Landslide Monitoring Survey
October 8, 2015 Full Monitoring
for the
City of Rancho Palos Verdes
prepared by
McGee Surveying Consulting
February 3, 2016

PROJECT OVERVIEW:

McGee Surveying Consulting performed a landslide monitoring and control survey dated October 8, 2015 at Portuguese Bend on behalf of the City of Rancho Palos Verdes. This survey established positions on monitoring points to determine overall and periodic movements. The results of the survey are described in this Report and in the attached spreadsheet titled "PB MOVEMENT DATA POSTING 2007-2015.10.xlsx". Two partial monitoring surveys will be performed in the winter and spring and reported as addendums to this Report.

The field survey was planned, coordinated and executed by Michael McGee, PLS3945 of McGee Surveying Consulting who was also responsible for the final processing of the observations, network adjustments, analysis and reports. The monitoring points cover a 1½ mile square area and are measured to determine the rate and extent of ground movement. This monitoring program has occurred annually since 2007, semi-annually since 2012 and three times a year beginning with the September 2014 survey. The area has been monitored by the City of Rancho Palos Verdes since 1994 and prior by the County of Los Angeles. The Global Navigation Satellite System (GNSS formerly referred to as GPS) technology was used to measure positions based on the North American Datum of 1983 (NAD83) and the North American Vertical Datum of 1988 (NAVD 88). This survey is referenced to the California CGPS (Continuous GPS) Stations in the region which are permanently mounted GPS receivers used for monitoring seismic activity. The CGPS in California are similar to the national CORS (Continuously Operated Reference Stations).

Points that move a few inches or less per year are required to meet an accuracy standard of one centimeter (0.033 feet) at the 95% Level of Confidence. In the active slide area where the movements are greater than 0.25 feet per year (PB and UB points), the accuracy standard is two centimeters (0.066 feet) at the 95% Level of Confidence. Field procedures are designed to accomplish this purpose and Quality Control-Quality Assurance (QAQC) processes discussed hereafter are incorporated to verify these accuracies are attained.

Prior to September 2007, successive coordinate differences were used to compute movements which do not provide statistical information about the relative movement accuracies. Beginning with the initial 2007 survey, field and office procedures were designed to assure the accuracy and reliability of measurements and provide for queries between epochs that include statistical information about the relative precisions of the reported movements. Thereafter, measurements of temporal movements are based on a rigorous simultaneous least squares adjustment of multiple observations at two different epochs for each point.

HISTORY

This monitoring survey is a continuation of a program initiated by the County of Los Angeles and taken over by the City of Rancho Palos Verdes circa 1994. McGee Surveying Consulting has conducted the field surveys and reporting since September 2007. See the September 2007 Survey Report for a history of the previous survey process between 1994 and 2007. See the Survey Reports subsequent to 2007 for details of each monitoring campaign. Beginning with the 2012 rainy season (begins in September) full monitoring continued as usual and a

partial monitoring was initiated in the following winter-spring. Beginning in September 2014 a full monitoring was conducted and a partial monitoring surveys were conducted in the February and April.

PROJECT DATUMS, REFERENCE SYSTEM

Horizontal Datum: North American Datum of 1983 established by the National Geodetic Survey (NGS) referred to as NAD83 (2007) 2007.00 Epoch. The NAD83 (2007) 2007.00 Epoch adjustment is one of a series of national adjustments of NAD83 since its adoption in 1986 and is the realization used for these monitoring surveys since 2007. The latest realization of NAD83 is the 2011 adjustment referred to as NAD83 (2011) 2010.00 Epoch; however, the above referenced 2007 realization is retained to be consistent with prior reporting and the primary purpose of determining relative changes over time.

Reference Network: The survey is referenced to the CGPS Stations (continuously operating GNSS receivers). For more information see NGS Data Sheets for the PID's listed below (no data sheet exists for PVE3). The positions listed below were obtained in September 2007 from the California Spatial Reference Center (CSRC). The CSRC provides CA Public Resources Code sanctioned positions for the California CGPS Stations.

Units: Feet

CGPS	Latitude (dms)	Longitude (dms)	EH (feet)	NGS PID	NAME
PVE3	33 44 35.853290	-118 24 15.269036	235.42	none	PALOS VERDES CORS
PVHS*	33 46 46.020150	-118 22 19.741258	853.99	AJ1915	PENINSULA HIGH SCH
PVRS**	33 46 25.891904	-118 19 14.067218	198.63	AJ1916	PALOS VERDES RES
VTIS	33 42 45.489584	-118 17 37.712290	197.52	AJ1936	MARINE EXCHANGE

* Not Operational During Survey

** Falls in the proximity of a Fault Line as shown below but appears unaffected to date

CGPS Stations (north up)

Vertical Datum: North American Vertical Datum of 1988 (NAVD88) established by the NGS.

Reference Network: CGPS Station VTIS is also a Second Order leveled benchmark and the original basis for the heights by this survey.

CGPS	NAVD88 Ht (feet)	
PVE3	none	
PVHS	972.1	Based on a Refined Geoid Model
PVRS	316.37	Based on Second Order Leveling by CSRC
VTIS	315.26	Based on Second Order Leveling by CSRC and original basis for this survey

Geoid Model: Geoid 03; note Geoid09 became available from the NGS in 2009 and Geoid12A in 2012; however, Geoid03 is retained to be consistent with prior reported heights and the primary purpose of determining relative changes over time.

Projection: NAD83 California State Plane Coordinates Zone 5 in US Feet: The State Plane Coordinate Parameters follow: The average Scale Factor is 1.00007543, the Height Reduction Factor based on the average ellipsoid heights is 0.99999092, and the average Combined Grid Factor is 1.00006635. Distances in this survey are grid. To obtain ground distances divide grid distances by the Combined Grid Factor. Grid bearings resulting from this survey must be rotated by a Convergence Angle to obtain geodetic (true) bearings. The average convergence angle is $-0-12-30\pm$ (rotate left 0-12-30).

Datum Stability: Rancho Palos Verdes sits on the Pacific Plate which is moving west-northwesterly relative to the North American Plate about 4 centimeters (0.14 feet) per year. The area southwesterly of the Fault Line shown on the above map includes the City and is moving at a constant rate as exhibited by the International Terrestrial Reference Frame (ITRF) north, east and up velocities of the CGPS Stations listed below. Note, there was no change.

SITE	ANNUAL VELOCITIES IN METERS			START_DATE	END_DATE
	N	E	U		
PVE3	0.019	-0.039	-0.000	2000.7327	2016.0397
PVRS	0.019	-0.039	0.000	1999.0948	2016.0397
VTIS	0.019	-0.039	-0.001	1998.9407	2016.0397

These CGPS Stations provide a rigid reference frame for the Portuguese Landslide Monitoring Program that is validated during each monitoring campaign. See the Adjustments results below and the September 2007 Monitoring Survey Report by McGee Surveying Consulting for additional information.

FIELD SURVEYS, DATA COLLECTION, EQUIPMENT & PROCESSING

Three Leica geodetic GNSS receivers/antennas listed below were mounted on two meter fixed height poles or tripod/tribrach to collect satellite signal data. The GS15 receivers track Navstar GPS and GLONASS satellites. Prior to initiating the field observations a calibration of the poles and tribrach were conducted to verify their heights and plumb. The top of the poles were found to be plumb within 0.003 feet of the bottom consistent with prior years. There were no equipment failures.

Sixty-nine monitoring points were occupied and reported in this survey. Site photographs and recovery sheets detailing the location, character of the monuments and obstructions were maintained and updated. See the Appendix for "Monitoring Point Status". Monument AB61, established in September 2007 on Portuguese Point, is used as the primary base station in each survey because it sits above a stable basalt formation. AB20 serves as a secondary base during the surveys.

The field survey commenced each day by setting a Leica GS15 GNSS receiver on a fixed height pole at AB61 and on a tribrach/tripod at AB20 while a third GS15 GNSS receiver roamed freely collecting observations on a fixed height pole at the other 68 points. Points with annual movements less than 0.25' were measured with two or more independent occupations resulting in a minimum of four vectors to each point from AB61 and AB20. Independent occupations means the points were occupied under a different constellation of satellites usually on a different day. If the two measurements were within 0.03 feet (1 cm) horizontally, they were accepted,

otherwise a third measurement was required. On each day over a six day period, vectors based on 8 hours of observations connected AB61, AB20 to the CGPS stations. Twenty points, in the active areas, with annual movements greater than 0.25' were single occupied. A comparison with the linear movements from prior years was made to verify their accuracy.

Many of the points are over-shadowed by mature trees and shrubberies which interfere with signals received from satellites and affect the quality of measurements. To obtain the best possible accuracies, the satellite constellation is compared with obstruction diagrams to estimate the best time for observing un-obstructed satellites. To improve the accuracy of the measurements, satellites obstructed by foliage and trees are either turned off during the observation or noted for removal in post-processing. If six or more un-obstructed satellites with a GDOP of less than three (measure of the geometry or strength of figure of the constellation) are available, then the measurement commenced for a minimum of 15 minutes of data collection. If the geometry and number of satellites are insufficient then the receiver was moved to another point and returned later when satellite availability improved.

Date of Survey: 10/04/15 to 10/13/15 (mean date 10/08/2015) between 0600-1800 PDST (+7 hrs for UTC).

GNSS Survey Parameters:

Constellation: 30 US NAVSTAR GPS satellites and 24 Russian GLONASS satellites.

Observables: GPS L1 & L2 and GLONASS L1 & L2 Carrier Waves

Epoch Rate - Occupation Times: 15 seconds epoch rate - 15 minute occupations at monitoring points and six 8 hour occupations at base stations.

Satellites: 11-17; GDOP \leq 2; Elevation Mask for Data Collection at 15° and Processing at 15°

Ephemeris: Rapid for Static Post-Processing of CGPS connections and Broadcast for onsite.

Weather: A mixture of clear and cloudy skies, temperature 68°-85° F, no significant weather.

Space Weather: Boulder K Index was 2-3 except 5-7 on 10/07/15, 3-5 on 10/12/15 and 4 on 10/13/15 (gauges ionospheric activity on a scale of 0-9; prefer less than 5 to avoid noisy data).

Equipment:

GNSS Base Receiver Unit No.: M5, Operator: M. McGee, PLS; Station Occupied: AB61 (Base1)

Make & Model: Leica GS15; Antenna Leica GS15; Mount: Fixed Height Pole #1; Antenna Height: 1.803m

GNSS Rover Receiver Unit No.: M6, Operator: M. McGee, PLS;

Make & Model: Leica GS15; Antenna Leica GS15; Mount: Fixed Height Pole #3; Antenna Height: 1.800m

GNSS Rover Receiver Unit No.: M7, Operator: M. McGee, PLS, Station Occupied: AB20 (Base2)

Make & Model: Leica GS15; Antenna Leica GS15; Mount: Tribrach on Tripod; Antenna Height: varies

Vectors were processed using Leica LGO v8.4 post processing software. Analysis of residuals led to the rejection of 5 out of 52 vectors connecting the CGPS Stations to AB61 and AB20, and 0 out of 226 vectors connecting monitoring points. Network adjustments and analysis were performed with "Starnet-PRO" version 8.1.2 software. Rinex files of the satellite measurements for the CGPS Stations were downloaded from the SOPAC website. The Rapid Ephemeris and Absolute Antenna Models were downloaded from the NGS website.

NETWORK

AB61, the primary Base Station, sits on Portuguese Point and is the focal point of the static network connecting the monitoring points and CGPS Stations. AB20, a second Base Station is centrally located sitting on top of a high bluff overlooking Portuguese Bend. Sixty-nine points and three CGPS Stations were connected with 278 vectors. See the following Network Maps and the Aerial View in the Appendix.

The monitoring plan utilizes the CGPS Stations to verify the stability of the reference frame. The primary CGPS Station used to control this survey is PVE3 located just south of City Hall and 1.8 miles west-northwest of Base Station AB61. CGPS Stations PVR3 (3.9 miles northeast) and VTIS (4.9 miles east-southeast) are used to validate the stability of the network. During this survey PVE3, PVR3 and VTIS were operating.

MONITORING POINT HISTORY and STATUS

This is the 13th Monitoring Survey. For data management purposes during the field survey and data processing, the point names are prefixed with the sequential number of the survey to distinguish between monitoring surveys. For example, on the 13th monitoring survey, AB61 was named M13AB61 where M13 indicates the sequence number of the survey since the initial September 2007 Monitoring Survey. The prefix is stripped in the COORDINATES LIST and FULL DATA POSTING.

Between 1994 and 2006, 149 monitoring points were established to monitor the Portuguese Bend Landslides, many of which were lost or destroyed. Sixty of the original points were recovered in 2007. Eight of the 60 points were deleted because they were in close proximity of other points better suited for GNSS satellite measurements leaving 52 points monitored and reported between September 2006 and September 2007. Three of the 52 points (AB09, KC11 & PB51) were monitored in September 2007 for the last time and replaced by new points, set nearby and better suited for satellite observations.

2007: Eighteen new points were set in 2007 and had their movements reported for the first time in the following December 2008 survey. In September, it was noted that KC01 was previously reported by others on 9/14/2006 to have moved N 29°E 1.24' from its 12/9/2005 position. In the September 2008 survey, a buried partially illegible brass cap in concrete stamped "COUNTY ENGINEER RE8869 1956 STA ??IELDS" was found S31°29'W 1.48 feet from the 1" IP used by this survey in the initial September 2007 and subsequent surveys. The original 1994 position of KC01 was re-referenced to the 1" IP, resulting in correct overall reported movements.

2008: In December 2008, 49 original and 18 new points were surveyed for a total of 67 monitoring points. In December, it was noted that AB05 had been disturbed by a mowing machine. AB05 was found chipped and leaning to southerly about 0.4'. The movement reporting resumed in 2009. Analysis of the movement and historic data made it possible to estimate the disturbance to within 0.05'. The original 1995 position of AB05 was re-referenced S14°02'E 0.29' to be consistent with the disturbed position, resulting in correct overall reported movements.

2009: PB64 was set east of the Archery Range to replace PB63 (set 2007) which had become unsafe to access and was lost in 2010. PB64 was reported for the first time in October 2010.

2010: Points AB03 and BB25 were discontinued. AB03 is on the edge of a cliff 192 feet west-southwest of AB61 making it redundant, and BB25 is on a freestanding rock susceptible to disturbance by wave action. In the summer of 2010, PB62 was destroyed by road construction and in October 2010, PB65 was set 24' south-southwest of PB62's location and reported for the first time in October 2011. The following points may have been disturbed prior to the October 2010 survey. AB05 appears to have been disturbed by mower machinery, AB15 (½" GIP in a meter box) is driven over by vehicles occasionally accessing an adjacent field, and KC02 (½" GIP in a meter box) is occasionally parked on by vehicles accessing the beach.

2011: In October, new points AB62 and AB63 (initially referred to as AB62R and AB63R) were set to replace AB06 and AB07 which were hazardous to occupy due to their location near the traveled way of Palos Verde Drive South.

2012: In September, prior to initiating the survey, eight new monuments AB64, AB65, AB66, AB67, AB68, CR53, KC17 and PB66 were constructed to replace AB54, AB18, AB52, AB55, AB15, CR52, KC04 and PB53 respectively. The monuments were replaced because of poor sky visibility except for KC04 which was difficult to access and AB55 which was destroyed by trenching in the past year. Monuments were set with the following design. Monuments set in soil are 1" x 5' GIP driven flush and encase in a 6" PVC pipe sitting on a concrete collar down about 18". Monuments set in asphalt are 1/2" x 2' rebar driven below the surface inside a free floating 2" concrete encased plastic collar.

2013: Points AB15, AB18, AB52, AB54, CR52, KC04 and PB53 were surveyed for the last time in 2012 and discontinued. BB52 is on a freestanding rock susceptible to disturbance by wave action and was monitored for the last time in October and discontinued.

2014: In April PB64 was monitored for the last time due to unsafe access conditions and PB67 (a 5' t-bar steel post driven 3' into the ground) was set NNW'ly about 250' as a replacement and reported for the first time in September 2014 after 4.5 months whereas all other points in the "PB Movement Data Posting" are reported for

11.5 months since October 2013. In September, AB69 about 260' NE of AB12 and AB70 about 140' SE of AB12 were set as potential replacements; however, AB69 was destroyed by lot improvements and AB70 proved to be too obstructed for accurate results.

2015: In April, new points PB68, PB69 and PB70 were set to monitor movements of "Palos Verdes Drive South" and reported in October. In October, Monitoring Point AB56 was found disturbed by construction and a magnetic nail in AC was set as a temporary replacement which was destroyed in the fall; therefore, no movement information is available. In October, the steel post for PB67 was not found and an inconspicuous 1/2" x 4' rebar was set in its place. Because of the rapid movement in this area a more permanent monument is not necessary.

See the "Monitoring Point Status" in the Appendix for the present status of monitoring points.

MINIMALLY CONSTRAINED ADJUSTMENTS & ANALYSIS

Adjustment 1: Adjustment to develop NAD83 (2007) 2007.00 Epoch Geodetic, Ellipsoid and State Plane Coordinates. CGPS Station PVE3 was fixed at its published NAD83 (2007) 2007.00 Epoch position in a Minimally Constrained Adjustment to determine positions and verify its stability relative to other CGPS stations. PVE3 is located 1.8 miles west of and outside the influence of the slide area. PVE3 has been fixed in all adjustments since 2007. The CSRC publishes a Time Series representing the horizontal and vertical stability of PVE3 which indicate the position has been stable prior to 2007. The primary base station AB61 and two other operating CGPS Stations were measured relative to PVE3 and used to assess stability of the survey reference frame. The positions are based on 8 hours of observations collected daily for six days and three hours on the seventh day. The coordinate differences from previous positions to the present are listed below in feet.

10/2013 Positions to 09/2014					9/2007 Positions to 09/2014			
ID	dN	dE	dZ		ID	dN	dE	dZ

VTIS	0.003	0.005	0.049		VTIS	-0.000	0.017	-0.007
AB17	0.015	-0.017	0.042		AB17	-0.004	-0.022	-0.020
AB61	-0.007	0.003	-0.001	<Base Station>	AB61	-0.005	0.007	-0.055
CR51	0.011	0.005	0.017		CR50	-0.038	-0.004	-0.026
KC16	0.014	0.008	0.010		KC16	0.013	-0.005	-0.048

Comments: The Base Station AB61 has no measureable horizontal difference since September 2014 and 2007 as referenced to PVE3. The differences at CGPS Station PVRS and VTIS demonstrate a possible consistent easterly shift and will be watched. PVRS and VTIS have no measureable vertical difference; however, the differences at several monitoring points are down and up over the last year and down from the 2007 survey. Notwithstanding the vertical is less precise than the horizontal positions, it would appear that there may be indications of subsidence which is left to the Geologists for an opinion. Given that PVE3 and AB61 are in agreement, the survey reference frame is deemed stable and successfully recovered. An adjustment constrained to the other CGPS Stations is not preferred or necessary because the purpose here is to track their movements over time to test the stability of the reference frame. See the "COORDINATE LIST" in the Appendix for a list of coordinates resulting from this adjustment. See prior Survey Reports for coordinates resulting from earlier surveys.

Adjustment 2: Adjustment to develop Orthometric Heights (Elevations) in NAVD88. The CGPS Station PVE3 was fixed horizontally and vertically at its NAVD88 orthometric height determined in the September 2007 survey. The 2007 height was based on the published 2nd Order NAVD88 Height of CGPS Station VTIS. This Adjustment combined the measured ellipsoid height differences with the NGS Geoid 03 (models the separation between the ellipsoid and geoid surfaces) to determine NAVD88 orthometric heights of the other CGPS Stations and the monitoring points. Vertical differences (dZ) for at key points in this survey are listed in the table in Adjustment #1 above.

ACCURACY

This survey conform to the intent of the California Spatial Reference Center & California Lands Surveyors Association's "GNSS Surveying Standards and Specifications, 1.1" (2014) and the Federal Geodetic Control Subcommittee (FGCS) "Specifications for GPS Relative Positioning" (1988).

Vector Residuals: The number of vectors, vector lengths, two dimensional residuals and the absolute value of the vertical residuals resulting from Adjustment #1 are listed below in feet. Thirty-three vectors to single occupied monitoring points are not included because they have no independent residuals and would optimistically skew the results. The statistics given below are applicable for all points.

Network	No.	Vector Lengths		Two Dimensional Residuals			Vertical Residuals (absolute)		
		Vary	Average	Average	Std.Dev.	Maximum	Average	Std.Dev.	Range
Monitoring Pt	193	479-7182	3333	0.009	0.005	0.037	0.011	0.011	-0.069 to +0.037
CGPS Sta's	47	1931-27757	18467	0.009	0.005	0.023	0.011	0.008	-0.024 to +0.023

Local Accuracy: The precisions and accuracy of vectors resulting from the minimally constrained adjustment at the 95% Level of Confidence are listed below in feet.

Network	Relative Distance Error		
	Average	Maximum	Av. Precision
Monitoring Pt	0.009	0.016	1: 278,300
CGPS Sta's	0.004	0.007	1:3,745,000

Coordinate Accuracy: The Standard Deviations (68% Level of Confidence) of the coordinates derived from Adjustment #1, relative to the CGPS Station PVE3 follow in feet.

	Monitoring Points			CGPS Stations		
	North	East	Up	North	East	Up
Average Standard Deviation	0.004	0.004	0.012	0.002	0.002	0.004
Maximum Standard Deviation	0.007	0.007	0.023	0.002	0.002	0.005

At the 95% confidence level, the average coordinate has a horizontal radius of circular error is 0.010 feet and a vertical of 0.024 feet with a max of 0.017 and 0.046 feet respectively.

Network Accuracy: The network accuracy (absolute accuracy relative to the reference frame) is expected to be less than 0.02 feet horizontal relative to the NAD83 Datum and Epoch based on the CGPS Stations.

NAVD88 Heights: The North American Vertical Datum of 1988 orthometric heights resulting from Adjustment #2 are derived from the difference in ellipsoid heights combined with the Geoid 03 model and constrained to the height of PVE3 determined in 2007. The average relative accuracy of the heights is 0.03 feet at the 95% level of confidence, but may be greater at obstructed sites. The absolute accuracy of the heights relative to the datum is dependent on the published orthometric height on the CGPS Station VTIS. Although relative elevation accuracies can be within 0.03 feet, up until October 2011 there were no requirements for vertical accuracies. In October 2011, a preference of 0.03 foot relative vertical accuracy was instigated for the following points: AB17, AB57, CR07, CR50 and CR51. In the September 2012 and subsequent surveys the criteria was extended to all points.

Movement Accuracy: For this period, 47 points are reported to have moved less than 0.30 feet with an average movement of 0.03 feet and a range of 0.00 to 0.15 feet. The relative error at the 95% Level of Confidence averaged 0.013 feet with a range of 0.005 to 0.019 feet. Overall, after removing outlier PB55 (severely obstructed site), the estimated 95% relative movement error averaged 0.014 feet with a range of 0.005 to 0.019 feet. No movement is considered detected unless the movement exceeds the 95% Error for individual points. See the attached "PB MOVEMENT DATA POSTING" for the estimated relative movement errors at the 95% Level of Confidence for individual points.

QUALITY CONTROL - QUALITY ASSURANCE (QAQC) ANALYSIS

To ensure the accuracy and validity of the measurement systems used in these GNSS monitoring surveys, an independent test was conducted in 2007 using conventional terrestrial based instruments as reported in the "QAQC ANALYSIS" section of the September 2007 Monitoring Survey Report. Comparing the results of the GNSS systems with conventional instrumentation found horizontal measurements agreed 0.01 feet on average. In November of 2011 the GNSS instruments and fixed height poles used in this survey were calibrated on the Santa Maria National Geodetic Survey Baseline and found to agree with published distances 0.003 to 0.006 feet.

To validate the radial survey method used in these surveys to position points from base stations AB61 and AB20, independent GNSS cross connections were measured and compared with the stand alone computed inverse distances in the 2007, 2008 and 2009 surveys. The results found the two dimensional accuracy to agree 0.01 feet on average, indicating the radial method of measurements is reliable and the additional labor cost of measuring cross connection between points is not warranted. See the "QAQC ANALYSIS" section of the September 2007 and the December 2008 Monitoring Survey Reports for detailed analysis.

Deflection Analysis is a method established by this surveyor to assess the consistency of the direction of movements reported from period to period. Assuming that movements are generally linear for points moving less than a foot, the separation or the deflection between the direction of the previous and present periods taken over the moved distance implies the accuracy obtained with the equipment, methods and procedures. Analysis of individual deflections indicates that for points with multiple occupations the separations varied 0.01 to 0.02 feet.

SUMMARY

The relative movements reported between September 19, 2014 and October 8, 2015 (12.6 months) statistically attained an average accuracy of 0.014 feet at the 95% Level of Confidence for points occupied two or more times. The actual accuracy of measurements held to the "one-centimeter standard" are estimated to approach 0.01 feet as demonstrated by the vector residuals, repeatability of measurements at points considered stable, and the analysis of movement deflections over time. Refer to the sections titled ACCURACY and QAQC ANALYSIS in this Report for more information.

Between September 19, 2014 and October 8, 2015 (12.6 months) point movements are reported as follows: Portuguese Bend Landslide (PB##) moved 0.05 to 1.80 feet and 8.55 feet at PB67, Abalone Cove Landslide (AB##) moved 0.02 to 0.05 feet, and Klondike Canyon (KC##) moved 0.02 to 0.03 feet. See the graphic depiction of the Horizontal Movement in the Appendix.

Statistically, the probability at the 95% level of confidence is that movement (signal) has occurred at a point when the horizontal distance between two epochs is greater than the 95% Error (noise). See the "Movement Data Posting" for a listing of the 95% Error estimates (range 0.011 to 0.019 feet not including single occupied points). Applying this criteria, 11 points have not moved.

See the attached "PB MOVEMENT DATA POSTING" spreadsheet for overall and periodic movements of each point. The movements are given in north, east and up or down as well as a vector of distance and direction relative to north. The direction is given as an azimuth in degrees where 0° is north and increases clockwise (90° East, 180° South, 270° West). The overall movements are from the beginning position of each point which varies between 1994 and the date for newly established points.

The present status of monitored points is provided in the Appendix under "Monitoring Point Status". The historical status of all monitoring points is provided in the September 2007 Survey Report. The historical 1994-2006 positions of all points are listed in the Charles Abbott Associates Inc. file "ALL POINTS MOST RECENT OBSERVED POSITION AS OF SEPTEMBER 15, 2006.xls" attached as an electronic file to the 2007 Report.

RECOMMENDATION

An ongoing re-location program for monuments has long term benefits resulting in better accuracy and lower cost surveys due to improved sky visibility for tracking satellites. In this October 2015 survey, no monuments were re-located. Points AB16, AB17, AB24 and AB58 have limited sky visibility and are candidates for re-located or deletion. AB12 is in a horse corral and is difficult to access; however, there are no nearby alternatives.

Attachments: The following document is attached to this Report. "PB MOVEMENT DATA POSTING" lists the coordinates of the initial positions, the overall and periodic movements of monitoring point since 2007.

SURVEYOR'S STATEMENT

This is a Report on the procedures, criteria and results of the City of Rancho Palos Verdes Portuguese Bend Landslide Monitoring Surveys. This Report includes the Initial Survey conducted in the fall, the Second Survey Addendum No.1 added in the winter and the Third Survey Addendum No.2 added in the spring. This survey was conducted and the report prepared by me at the request of Ron Drago, Principal Engineer of the City of Rancho Palos Verdes.

Initial Survey - Full Monitoring Signature

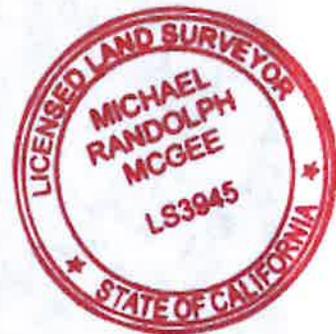

Michael R. McGee P.L.S. 3945 Date 02/03/16

Second Survey - Partial Monitoring Signature

Michael R. McGee P.L.S. 3945 Date 03/11/16

Third Survey - Partial Monitoring Signature

Michael R. McGee P.L.S. 3945 Date 04/22/16

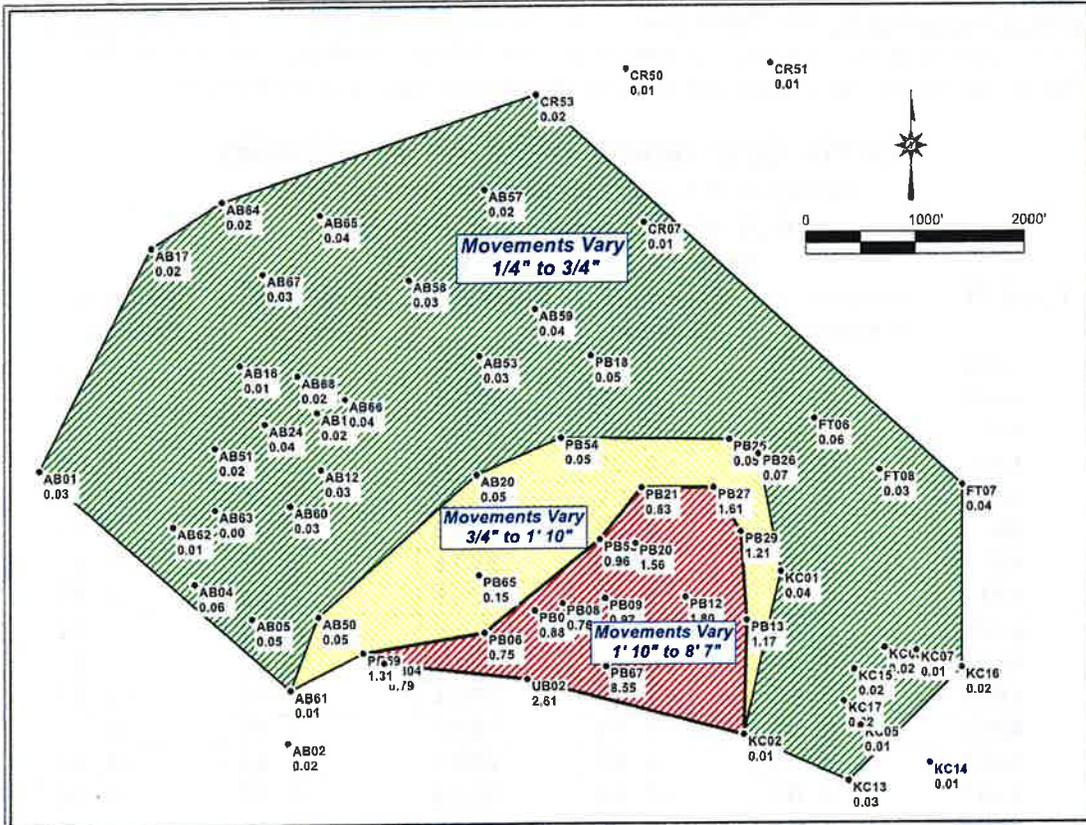

APPENDIX

Addendum No.1
Second Survey Report
Portuguese Bend Landslide Monitoring
February 16, 2016 Partial Monitoring Survey
for the
City of Rancho Palos Verdes
by
McGee Surveying Consulting
March 11, 2016

Overview:

This Addendum No. 1 Report describes the February 2016 tri-annual Portuguese Bend Monitoring Survey. This partial survey included a sub-set of 30 points of the full monitoring set. Monitoring point AB56 was destroyed sometime after the April 2015 survey and AB71A was set in October as a replacement which was destroyed by paving sometime in the fall. Therefore, two new points AB71B and AB71C were set as temporary replacements until a permanent monument is set in the fall 2016 survey.

This survey followed the procedures described in the above October 8, 2015 Full Monitoring Report. For a detailed history of the program and surveys see "History" above and previous Monitoring Survey Reports back to 2007. The field survey took place February 15-18, 2016. The Field Surveys, Equipment, Data Collection and Network Design were as described in the above Report. The survey included 30 onsite points, two of which were base stations connecting each point with two to six vectors. Three continuously operating GPS stations (CGPS) were connected to this survey with 4-6 eight hours vectors each. It is to be noted that solar activity was high during the survey resulting in a minor increase in noise for the data collection.

The movements reported between October 8, 2016 and February 16, 2016 (4.3 months) statistically attained an average accuracy of 0.012 feet at the 95% Level of Confidence. The overall vectors residuals follow: the 2D averaged 0.005' with a maximum of 0.014' and the vertical averaged 0.012' with a maximum of 0.049'.

A Minimally Constrained Adjustment was processed to develop NAD83 (2007) 2007.00 Epoch Geodetic, Ellipsoid and State Plane Coordinates in feet. CGPS Station PVE3 was fixed and the differences are listed in feet from the October 08, 2016 to the February 16, 2016 positions for the CGPS stations and points considered to mostly stable.

10/2015 Positions to 02/2016				
Station	dN	dE	dZ	
AB17	-0.012	0.004	0.004	
AB50	-0.010	-0.009	0.024	
AB61	-0.001	0.001	0.009	Primary Base Station
CR50	-0.001	-0.004	0.045	
KC16	-0.024	0.014	0.001	
PVE3	0.000	0.000	0.000	Fixed CGPS Station
PVRS	-0.011	-0.002	-0.011	CGPS Station
VTIS	-0.007	-0.013	-0.007	CGPS Station

The adjustment, as a standard procedure, was constrained to the CGPS station PVE3 which finds no significant difference as expected in the horizontal position at the primary base station AB61. The difference at CGPS stations PVRS is 0.01 feet compared to the October 08, 2016 position. The survey reference frame was deemed stable and successfully recovered. The results are reported below.

Addendum No.2
Third Survey Report
Portuguese Bend Landslide Monitoring
April 19, 2016 Partial Monitoring Survey
for the
City of Rancho Palos Verdes
by
McGee Surveying Consulting
April 22, 2016

Overview:

This Addendum No. 2 Report describes the April 2016 Portuguese Bend Monitoring Survey. This partial survey included the same sub-set of 30 points reported in Addendum No.1.

This survey followed the procedures described in the above October 8, 2015 Full Monitoring Report. For a detailed history of the program and surveys see "History" above and previous Monitoring Survey Reports back to 2007. The field survey took place April 17-20, 2016. The Field Surveys, Equipment, Data Collection and Network Design were as described in the above Report. The survey included 30 onsite points, two of which were base stations connecting each point with two to four vectors. Two continuously operating GPS stations (CGPS) were connected to this survey with eight 3-7 hours vectors. It is to be noted that solar activity was low during the survey resulting in less noise for the field data collection.

The movements reported between February 16, 2016 and April 19, 2016 (2.0 months) statistically attained an average accuracy of 0.012 feet at the 95% Level of Confidence. The overall vectors residuals follow: the 2D averaged 0.005' with a maximum of 0.016' and the vertical averaged 0.008' with a maximum of 0.037'.

A Minimally Constrained Adjustment was processed to develop NAD83 (2007) 2007.00 Epoch Geodetic, Ellipsoid and State Plane Coordinates in feet. CGPS Station PVE3 was fixed and the differences are listed in feet from the February 16, 2016 to the April 19, 2016 positions for the CGPS stations and points considered to mostly stable.

02/2016 Positions to 04/2016

<u>Station</u>	<u>dN</u>	<u>dE</u>	<u>dZ</u>	
AB17	-0.002	0.005	0.025

PVRS	0.012	0.002	0.026	CGPS Station
VTIS	(Not Operating during survey)			CGPS Station

The adjustment, as a standard procedure, was constrained to the CGPS station PVE3 which finds no significant difference as expected in the horizontal position at the primary base station AB61. The difference at CGPS stations PVRS is 0.01 feet compared to the February 16, 2016 position and 0.00 feet compared to the October 8, 2015 position. The survey reference frame was deemed stable and successfully recovered. The results are reported below.

Survey Report
of the
Portuguese Bend Landslide Monitoring Survey
September 19, 2013 Full Monitoring
for the
City of Rancho Palos Verdes
by
McGee Surveying Consulting

PROJECT OVERVIEW:

McGee Surveying Consulting performed a landslide monitoring and control survey in September 2014 at Portuguese Bend on behalf of the City of Rancho Palos Verdes. This survey established positions on monitoring points to determine overall and periodic movements. The results of the survey are described in this Report and on an attached spreadsheet titled "MOVEMENT DATA POSTING.xlsx" hereafter referred to as the "Movement Data Posting". A two partial monitoring surveys will be performed in the winter and spring of 2015 and reported as an addendum to this Report.

The field survey was planned, coordinated and executed by Michael McGee, PLS3945 of McGee Surveying Consulting who was also responsible for the final processing of the observations, network adjustments, analysis and reports. The monitoring points cover a 1½ mile square area and are measured to determine the rate and extent of ground movement. The monitoring has occurred annually since 2007, semi-annually for the last two years and will be three times a year beginning with the September 2014 survey. The Global Navigation Satellite System (GNSS formerly referred to as GPS) technology was used to measure positions based on the North American Datum of 1983 (NAD83) and the North American Vertical Datum of 1988 (NAVD 88). This survey is referenced to the California CGPS (Continuous GPS) Stations in the region which are permanently mounted GPS receivers used for monitoring seismic activity. The CGPS in California are similar to the national CORS (Continuously Operated Reference Stations).

Points that move a few inches or less per year are required to meet an accuracy standard of one centimeter (0.033 feet) at the 95% Level of Confidence. In the active slide area where the movements are greater than 0.3 feet per year (PB and UB points in the central portion), the accuracy standard is two centimeters (0.066 feet) at the 95% Level of Confidence. Field procedures are designed to accomplish this purpose and Quality Control-Quality Assurance (QAQC) processes discussed hereafter are incorporated to verify these accuracies are attained.

The movements reported between October 4, 2013 and September 19, 2014 (11.5 months) statistically attained an average accuracy of 0.016 feet at the 95% Level of Confidence. The actual accuracy of measurements held to the one centimeter standard are estimated to approach 0.01 feet as demonstrated by the vector residuals, repeatability of measurements at points considered stable, and the analysis of movement deflections over time. Refer to the sections titled ACCURACY and QAQC ANALYSIS in this Report for more information.

HISTORY

This monitoring survey is a continuation of a program initiated by the County of Los Angeles and taken over by the City of Rancho Palos Verdes circa 1994. McGee Surveying Consulting has conducted the field surveys and reporting since September 2007. See the September 2007 Survey Report for a history of the previous survey process between 1994 and 2007. See the subsequent annual Survey Reports for details of each monitoring campaign. Beginning with the 2012 rainy season (begins in September) full monitoring continued as usual and a partial monitoring was initiated in the following winter-spring. Beginning in September 2014 a full monitoring will be conducted and a partial monitoring will be conducted in the following January-February and April-May.

PROJECT DATUMS, REFERENCE SYSTEM

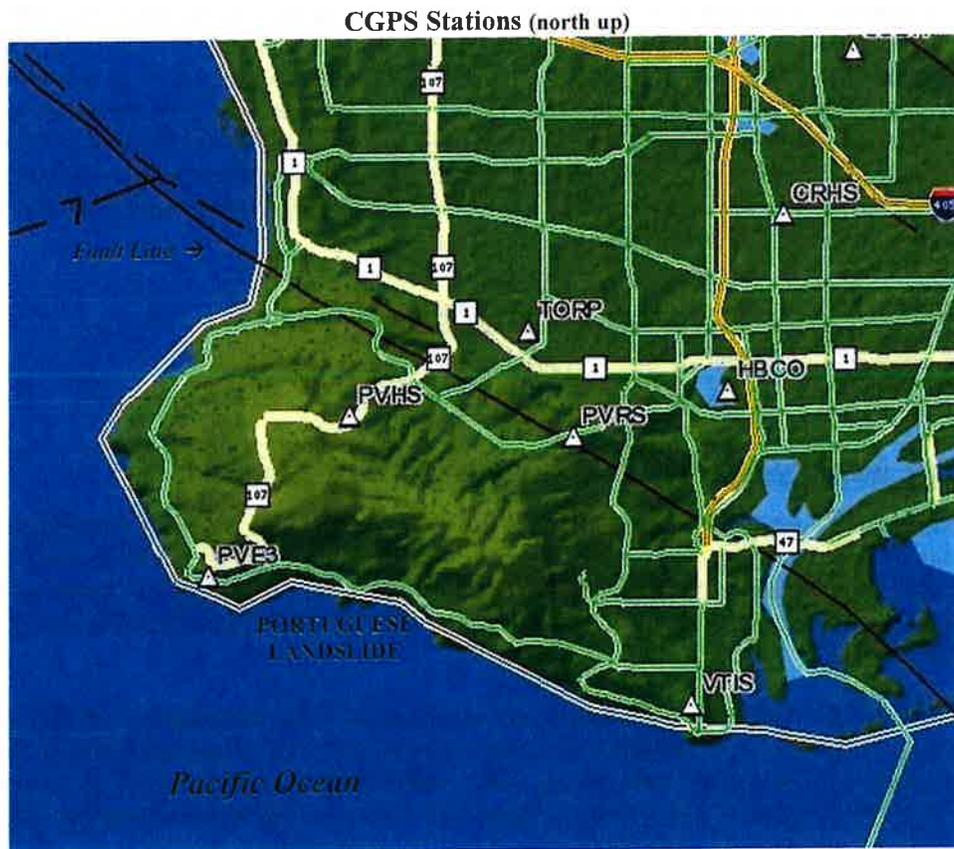

Horizontal Datum: North American Datum of 1983 (NAD83) established by the National Geodetic Survey (NGS); **Epoch:** 2007.00 referred to as NAD83 (2007); **Units:** Feet

Reference Network: The survey is referenced to the CGPS Stations (continuously operating GNSS receivers). For more information see NGS Data Sheets for the PID's listed below (no data sheet exists for PVE3). The positions listed below were obtained in September 2007 from the California Spatial Reference Center (CSRC). The CSRC provides CA Public Resources Code sanctioned positions for the California CGPS Stations.

CGPS	Latitude (dms)	Longitude (dms)	EH (feet)	NGS PID	NAME
PVE3	33 44 35.853290	-118 24 15.269036	235.42	none	PALOS VERDES CORS
PVHS*	33 46 46.020150	-118 22 19.741258	853.99	AJ1915	PENINSULA HIGH SCH
PVRS**	33 46 25.891904	-118 19 14.067218	198.63	AJ1916	PALOS VERDES RES
VTIS*	33 42 45.489584	-118 17 37.712290	197.52	AJ1936	MARINE EXCHANGE

* Not Operational During Survey

** Falls in the proximity of a Fault Line as shown below but appears unaffected to date

Vertical Datum: North American Vertical Datum of 1988 (NAVD88) established by the NGS.

Geoid Model: Geoid 03; note Geoid09 became available from the NGS in 2009 and Geoid12A in 2012; however, Geoid03 is retained to be consistent with prior reported heights and the primary purpose of determining relative changes over time.

Reference Network: CGPS Station VTIS is also a Second Order leveled benchmark and the original basis for the heights by this survey (see NGS Data Sheets for PID's listed above)

<u>CGPS</u>	<u>NAVD88 Ht (feet)</u>	
PVE3	none	
PVHS	972.1	Based on a Refined Geoid Model
PVRS	316.37	Based on Second Order Leveling by CSRC
VTIS	315.26	Based on Second Order Leveling by CSRC and original basis for this survey

Projection: NAD83 California State Plane Coordinates Zone 5: The State Plane Coordinate Parameters follow: The average Scale Factor is 1.00007543, the Height Reduction Factor based on the average ellipsoid heights is 0.99999092, and the average Combined Grid Factor is 1.00006635. Distances in this survey are grid. To obtain ground distances divide grid distances by the Combined Grid Factor. Grid bearings resulting from this survey must be rotated by a Convergence Angle to obtain geodetic (true) bearings. The average convergence angle is $-0-12-30\pm$ (rotate left 0-12-30).

Datum Stability: The NAD83 (2007) Epoch 2007.00 adjustment is one of a series of national adjustments of NAD83 since its adoption in 1986 and is the realization used for these monitoring surveys since 2007. Rancho Palos Verdes sits on the Pacific Plate which is moving west-northwesterly relative to the North American Plate about 4 centimeters (0.14 feet) per year. The area southwesterly of the Fault Line shown on the above map includes the City and is moving at a constant rate as exhibited by the International Terrestrial Reference Frame (ITRF) north, east and up velocities of the CGPS Stations listed below. These CGPS Stations provide a rigid reference frame for the Portuguese Landslide Monitoring Program that is validated during each monitoring campaign. See the Adjustment results below and the September 2007 Monitoring Survey Report by McGee Surveying Consulting for additional information.

FIELD SURVEYS, DATA COLLECTION, EQUIPMENT & PROCESSING

Three Leica geodetic GNSS receivers/antennas listed below were mounted on two meter fixed height poles to collect satellite signal data. The GS15 receivers track Navstar GPS and GLONASS satellites. Prior to initiating the field observations a calibration of the fixed height poles was conducted to verify their heights and plumb. The top of the poles were found to be plumb within 0.003 feet of the bottom consistent with prior years. There were no equipment failures.

Sixty-four monitoring points were occupied and reported in this survey. Site photographs and recovery sheets detailing the location, character of the monuments and obstructions were maintained and updated. See the Appendix for "Monitoring Point Status". Monument AB61, established in September 2007 on Portuguese Point, is used as the primary base station in each survey because it sits above a stable basalt formation. AB20 serves as a secondary base for the surveys.

The field survey commenced each day by setting a Leica GS15 GNSS receiver on a fixed height pole at AB61 and on a tribrach on a tripod at AB20 while a third GS15 GNSS receiver roamed freely collecting observations on a fixed height pole at the other 62 points. Points with annual movements less than 0.3' were measured with two or more independent occupations resulting in a minimum of four vectors to each point from AB61 and AB20. Independent occupations means the points were occupied under a different constellation of satellites usually on a different day. If the two measurements were within 0.03 feet (1 cm) horizontally they were accepted, otherwise a third measurement was obtained. On each day over a six day period, vectors based on 4-10 hours of observations connected AB61, AB20 to the CGPS stations. Sixteen points, in the active areas, with

annual movements greater than 0.3' were single occupied. A comparison with the linear movements from prior years was made to verify their accuracy.

Many of the points are over-shadowed by mature trees and shrubberies which interfere with signals received from satellites and affect the quality of measurements. To obtain the best possible accuracies, the satellite constellation is compared with obstruction diagrams to estimate the best time for observing un-obstructed satellites. To improve the accuracy of the measurements, satellites obstructed by foliage and trees are either turned off during the observation or noted for removal in post-processing. If six or more un-obstructed satellites with a GDOP of less than four (measure of the geometry or strength of figure of the constellation) are available, then the measurement commenced for a minimum of 15 minutes of data collection. If the geometry and number of satellites are insufficient then the receiver was moved to another point and returned later when satellite availability improved.

Date of Survey: 9/16/14 to 9/22/14 (mean date 9/19/2014) between 0600-1800 PDST (+7 hrs for UTC).

GNSS Survey Parameters:

Constellation: 30 US NAVSTAR GPS satellites and 24 Russian GLONASS satellites.

Observables: GPS L1 & L2 and GLONASS L1 & L2 Carrier Waves

Epoch Rate & Occupation Times: 15 seconds epochs for 15 minutes and 4-10 hours at base stations

Satellites: 12-17; GDOP < 2.1; Elevation Mask for Data Collection at 15° and Processing at 15°

Ephemeris: Rapid for Static Post-Processing of CGPS connections and Broadcast for onsite.

Weather: Generally clear skies, temperature 67°-80° F.

Space Weather: Boulder K Index was 1-3 except it reached 4 between 1100-1400 hours on 9/19/14 (gauges ionospheric activity on a scale of 0-9, 5 or greater can result in noisy data).

Equipment:

GNSS Base Receiver Unit No.: M5, Operator: M. McGee, PLS; Station Occupied: AB61 (Base1)

Make & Model: Leica GS15; Antenna Leica GS15; Mount: Fixed Height Pole #1; Antenna Height: 1.803m

GNSS Rover Receiver Unit No.: M6, Operator: M. McGee, PLS;

Make & Model: Leica GS15; Antenna Leica GS15; Mount: Fixed Height Pole #3; Antenna Height: 1.800m

GNSS Rover Receiver Unit No.: M7, Operator: M. McGee, PLS, Station Occupied: AB20 (Base2)

Make & Model: Leica GS15; Antenna Leica GS15; Mount: Tribrach on Tripod; Antenna Height: varies

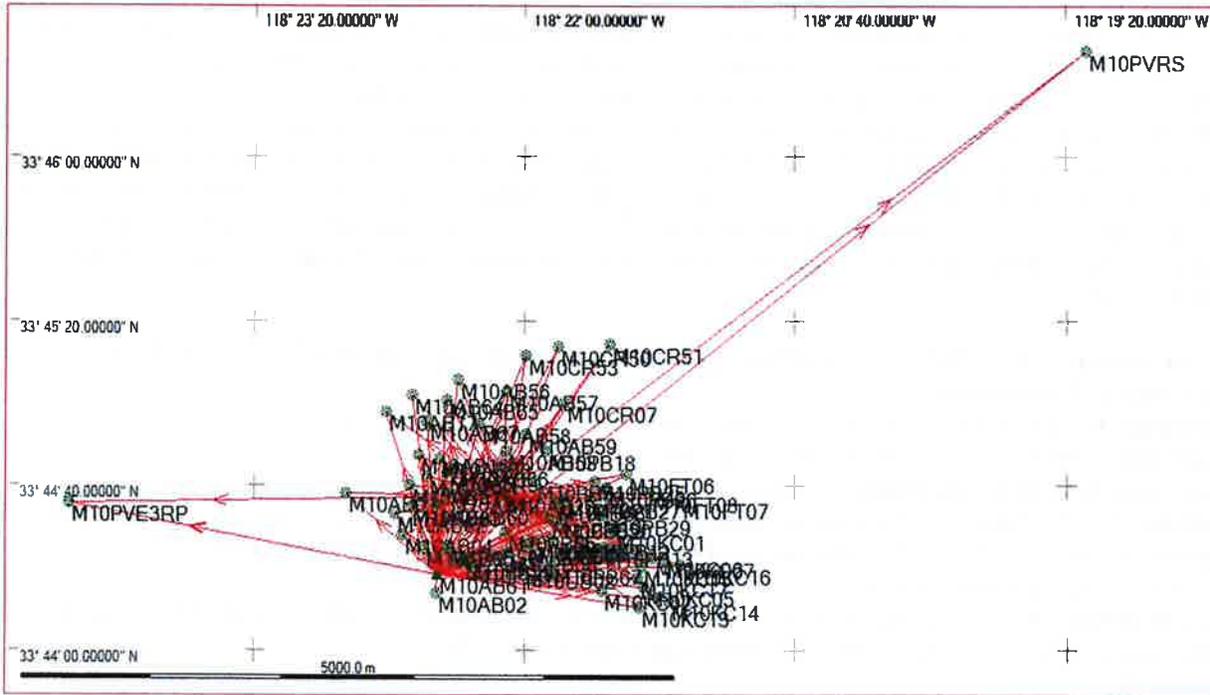

Vectors were processed using Leica LGO v8.1 post processing software. Analysis of residuals led to the rejection of 0 out of 29 vectors connecting the CGPS Stations to AB61 and AB20, and 0 out of 220 vectors connecting monitoring points. Network adjustments and analysis were performed with "Starnet-PRO" version 7.2.0.21 software. Rinex files of the satellite measurements for the CGPS Stations were downloaded from the SOPAC website. The Rapid Ephemeris and Absolute Antenna Models were downloaded from the NGS website.

NETWORK

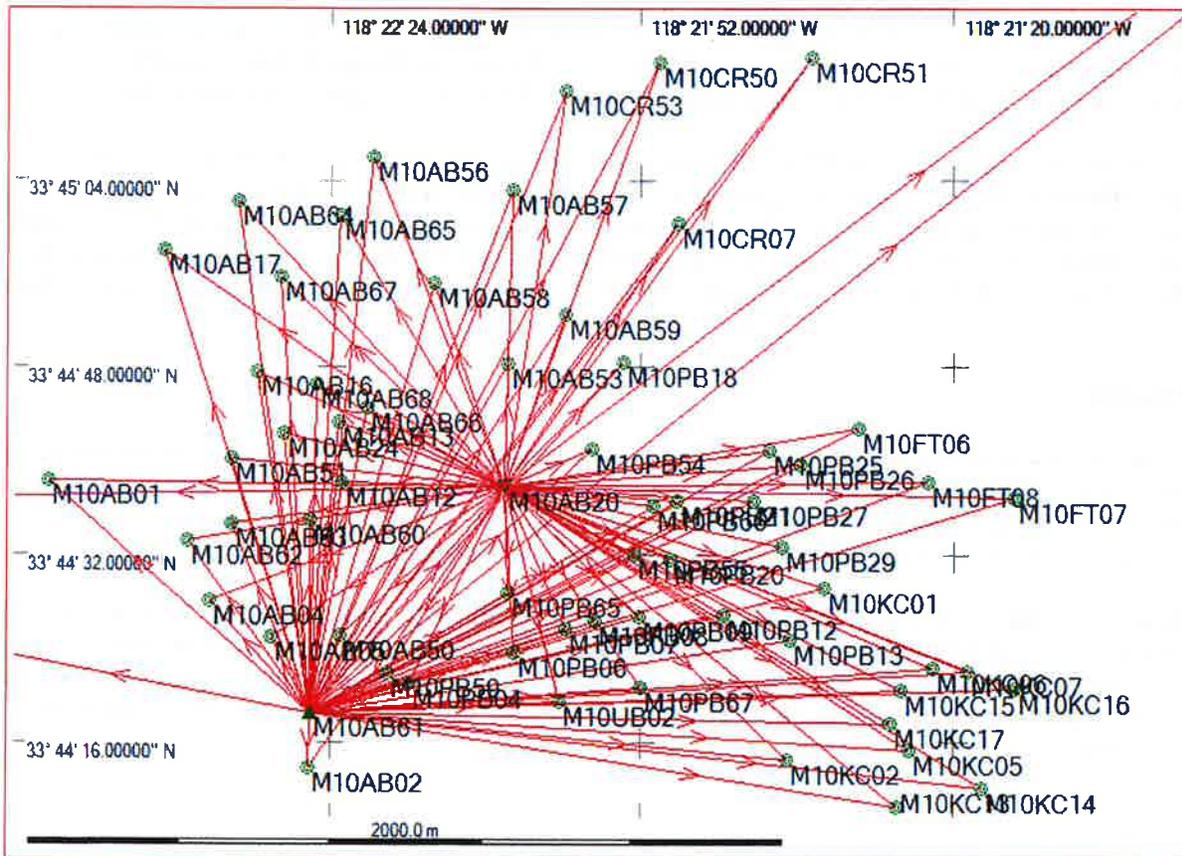

AB61, the primary Base Station, sits on Portuguese Point and is the focal point of the static network connecting the monitoring points and CGPS Stations. AB20, a second Base Station is centrally located sitting on top of a high bluff overlooking Portuguese Bend. Sixty-four points and two CGPS Stations were connected with 249 vectors. See the following Network Maps and the Aerial View in the Appendix.

The monitoring plan utilizes the CGPS Stations to verify the stability of the reference frame. The primary CGPS Station used to control this survey is PVE3 located just south of City Hall and 1.8 miles west-northwest of Base Station AB61. CGPS Station PVHS is 2.8 miles north, PVRS is 3.9 miles northeast, and VTIS is 4.9 miles east-southeast of AB61 are used to validate the stability of the network. During this survey only PVE3 and PVRS were operating.

Monitoring Network with CGPS Stations (north up)

Monitoring Network (north up)

MONITORING POINT HISTORY and STATUS

For data management purposes during the field survey and data processing, the point names were prefixed with "M10" to distinguish between the different monitoring surveys i.e. AB61 was named M10AB61. M10 indicates this survey is the 10th monitoring since the initial September 2007 Monitoring Survey. The prefix is stripped in the COORDINATES LIST and FULL DATA POSTING.

Between 1994 and 2006, 149 monitoring points were established to monitor the Portuguese Bend Landslides, many of which were lost or destroyed. Sixty of the original points were recovered in 2007. Eight of the 60 points were deleted because they were in close proximity of other points better suited for GNSS satellite measurements leaving 52 points monitored and reported between September 2006 and September 2007. Three of the 52 points (AB09, KC11 & PB51) were monitored in September 2007 for the last time because they were replaced by new points, set nearby and better suited for satellite observations. Eighteen new points were set in 2007 and had their movements reported for the first time in the following December 2008 survey. Therefore, in December 2008, 49 original and 18 new points were surveyed for a total of 67 monitoring points.

In the September 2007 Report, it was noted that KC01 was previously reported by others on 9/14/2006 to have moved N 29°E 1.24' from its 12/9/2005 position. In the 2008 survey, a buried partially illegible brass cap in concrete stamped "COUNTY ENGINEER RE8869 1956 STA ??IELDS" was found S31°29'W 1.48 feet from the 1" IP used by this survey in the initial September 2007 and subsequent surveys. The original 1994 position of KC01 was re-referenced to the 1" IP, resulting in correct overall reported movements.

In the December 2008 Report, it was noted that AB05 had been disturbed by a mowing machine. AB05 was found chipped and leaning to southerly about 0.4'. The movement reporting resumed in 2009. Analysis of the movement and historic data made it possible to estimate the disturbance to within 0.05'. The original 1995 position of AB05 was re-referenced S14°02'E 0.29' to be consistent with the disturbed position, resulting in correct overall reported movements.

In 2009, PB64 was set east of the Archery Range to replace PB63 (set 2007) which had become unsafe to access and was lost in 2010. PB64 was reported for the first time in October 2010.

In 2010, points AB03 and BB25 were discontinued. AB03 is on the edge of a cliff 192 feet west-southwest of AB61 making it redundant, and BB25 is on a freestanding rock susceptible to disturbance by wave action. In the summer of 2010, PB62 was destroyed by road construction. In October 2010, PB65 was set 24' south-southwest of PB62 and reported for the first time in October 2011. The following points may have been disturbed prior to the October 2010 survey. AB05 appears to have been disturbed by mower machinery, AB15 (½" GIP in a meter box) is driven over by vehicles occasionally accessing an adjacent field, and KC02 (½" GIP in a meter box) is occasionally parked on by vehicles accessing the beach.

In October 2011, new points AB62 and AB63 (initially referred to as AB62R and AB63R) were set to replace AB06 and AB07 which were hazardous to occupy due to their location near the traveled way of Palos Verde Drive South.

Prior to initiating the September 2012 survey, eight new monuments AB64, AB65, AB66, AB67, AB68, CR53, KC17 and PB66 were constructed to replace AB54, AB18, AB52, AB55, AB15, CR52, KC04 and PB53 respectively. The monuments were replaced because of poor sky visibility except for KC04 which was difficult to access and AB55 which was destroyed by trenching in the past year. Monuments were set with the following design. Monuments set in soil are 1" x 5' GIP driven flush and encase in a 6" PVC pipe sitting on a concrete collar down about 18". Monuments set in asphalt are 1/2" x 2' rebar driven below the surface inside a free floating 2" concrete collar.

In September 2012, points AB15, AB18, AB52, AB54, CR52, KC04 and PB53 were surveyed for the last time and discontinued in October 2013.

In April 2014, PB64 was monitored for the last time due to unsafe conditions for access and PB67 (a 5' t-bar steel post driven 3' into the ground) was set about 300' northerly as a replacement and reported for the first time in September 2014. BB52 is on a freestanding rock susceptible to disturbance by wave action and was monitored for the last time and discontinued.

In the September 2014 survey, two of the four CGPS Stations PVHS and VTIS were not operating. PB67 was reported for the first time but only for 4.5 months since the April 2014 survey whereas, all other points in the "Movement Data Posting" are reported for the 11.5 months since October 2013. See the "Monitoring Point Status" in the Appendix for the present status of monitoring points.

ADJUSTMENTS & ANALYSIS

Adjustment 1: Minimally Constrained Adjustment processed to develop NAD83 (2007) 2007.00 Epoch Geodetic, Ellipsoid and State Plane Coordinates.

Fixed Control: CGPS Station PVE3 was fixed at its published NAD83 (2007) position in a Minimally Constrained Adjustment to determine positions and verify its stability relative to other CGPS stations. PVE3 is located 1.8 miles west of and outside the influence of the slide area. PVE3 has been fixed in all adjustments since 2007. The CSRC publishes a Time Series for the horizontal and vertical stability of PVE3 which indicate the position has been stable prior to 2007. The primary base station AB61 and one other operating CGPS Stations was measured relative to PVE3 and used to assess stability of the survey reference frame. The positions are based on 4 to 10 hour measurements collected over six days. The coordinate differences from previous positions to the present are listed below in feet.

10/2013 Positions to 09/2014					9/2007 Positions to 09/2014			
Station	dN	dE	dZ		Station	dN	dE	dZ
PVE3	0.000	0.000	0.000	< Fixed >	PVE3	0.000	0.000	0.000
PVRS	-0.011	-0.011	-0.003		PVRS	-0.005	0.009	-0.016
AB17	0.004	0.029	-0.078		AB17	-0.019	-0.005	-0.062
AB61	0.019	-0.005	-0.005	<Base Station>	AB61	0.002	0.004	-0.054
CR51	0.001	-0.006	-0.047		CR51	-0.038	0.010	-0.129
KC16	0.004	-0.023	-0.038		KC16	-0.001	-0.013	-0.058

The following is noted: The base station AB61 has no indication of movement horizontally since 2007 and well as the CGPS Station PVRS relative to CGPS Station PVE3. Both CGPS Stations are well outside the slide areas. The vertical differences at several stations are larger than seen in past years for which there is no explanation at this time. The survey reference frame is deemed stable and successfully recovered at the level of 0.01 feet horizontally by 0.02 feet vertically as indicated. An adjustment constrained to the other CGPS Stations is not preferred or necessary because the purpose here is to track their positions over time to test the stability of the reference frame. See the "COORDINATE LIST" in the Appendix for a list of coordinates resulting from this adjustment. See prior Survey Reports for coordinates resulting from earlier surveys.

Adjustment 2: Minimally Constrained Adjustment to develop Orthometric Heights (Elevations) in NAVD88

Fixed Control: The CGPS Station PVE3 was fixed horizontally and vertically at its NAVD88 orthometric height determined in the September 2007 survey. The 2007 height was based on the published 2nd Order NAVD88 Height of CGPS Station VTIS. This Adjustment combined the measured ellipsoid height differences with the NGS Geoid 03 (models the separation between the ellipsoid and geoid surfaces) to determine NAVD88 orthometric heights of the other CGPS Stations and the monitoring points. See the Adjustment #1 above for vertical differences at key points in this survey.

ACCURACY

These surveys conform to the intent of the Federal Geodetic Control Subcommittee (FGCS) “Specifications for GPS Relative Positioning” (1988) and the California Geodetic Control Committee (CGCC) “Specifications for High-Production GPS Surveying Techniques” (1993).

Vector Residuals: The number of vectors, vector lengths, two dimensional residuals and the absolute value of the vertical residuals resulting from Adjustment #1 are listed below in feet. Thirty-four vectors to single occupied monitoring points are not included because they have no residuals and would optimistically skew the results. The statistics given below are applicable to all points.

Network	No.	Vector Lengths		Two Dimensional Residuals			Vertical Residuals (absolute)		
		Vary	Average	Average	Std.Dev.	Maximum	Average	Std.Dev.	Range
Monitoring	186	479-7182	3320	0.007	0.004	0.021	0.008	0.007	-0.031 to +0.028
CGPS	29	13-20692	14203	0.005	0.004	0.018	0.011	0.010	-0.023 to +0.034

Local Accuracy: The precisions and accuracy of vectors resulting from the minimally constrained adjustment at the 95% Level of Confidence are listed below in feet.

Network	Relative Distance Error		
	Average	Maximum	Av. Precision
Monitoring	0.008	0.010	1: 474,000
CGPS	0.004	0.004	1:2,841,000

The precision ratio, based on the averages for vectors connecting the Monitoring Points, exceeds the criteria for a First Order (C-1) by a factor of 4.7. The precision ratio for vectors connecting AB61, AB20 and the CGPS Stations exceeds the criteria for a B Order survey by a factor of 2.8 per the FGCS requirements for the former classification system.

Coordinate Accuracy: The Standard Deviations (68% Level of Confidence) of the coordinates derived from Adjustment #1, relative to the CGPS Station PVE3 follow in feet.

	Monitoring Point			CGPS Stations		
	North	East	Up	North	East	Up
Average Standard Deviation	0.004	0.003	0.009	0.002	0.002	0.005
Average 95% Error	0.009	0.008	0.017	0.002	0.002	0.005
Maximum Standard Deviation	0.005	0.004	0.012	0.002	0.002	0.005

At the 95% confidence level, the average coordinate has a horizontal radius of circular error is 0.009 feet and a vertical of 0.016 feet with a max of 0.011 and 0.024 feet respectively.

Network Accuracy: The network accuracy (absolute accuracy relative to the reference frame) is expected to be less than 0.02 feet horizontal relative to the NAD83 Datum based on the CGPS Stations.

NAVD88 Heights: The North American Vertical Datum of 1988 orthometric heights resulting from Adjustment #2 are derived from the difference in ellipsoid heights combined with the Geoid 03 model and constrained to the height of PVE3 determined in 2007. The average relative accuracy of the heights is 0.03 feet at the 95% level of confidence but may be greater at obstructed sites. The absolute accuracy of the heights relative to the datum is dependent on the published value on the CGPS Station VTIS. Although relative elevation accuracies can be within 0.03 feet, up until October 2011 there were no requirements for vertical accuracies. In October 2011, a preference of 0.03 foot relative vertical accuracy was instigated for the following points: AB17, AB57, CR07, CR50 and CR51. In the September 2012 and subsequent surveys the criteria was extended to all points.

Movement Accuracy: For this period, 48 points moved less than 0.30 feet with an average movement of 0.03 feet and a range of 0.01 to 0.08 feet. The relative error at the 95% Level of Confidence averaged 0.015 feet with a range of 0.006 to 0.028 feet. Overall, the estimated 95% relative movement error averaged 0.016 feet with a range of 0.006 to 0.028 feet. No movement is considered detected unless the movement exceeds the 95% Error

for individual points. See the attached "MOVEMENT DATA POSTING" for the estimated relative movement errors at the 95% Level of Confidence for individual points for any period.

QUALITY CONTROL - QUALITY ASSURANCE (QAQC) ANALYSIS

To ensure the accuracy and validity of the measurement systems used in these GNSS monitoring surveys, an independent test was made using conventional terrestrial based instruments as reported in the "QAQC ANALYSIS" section of the September 2007 Monitoring Survey Report. Comparing the results of the GNSS systems with conventional instrumentation found horizontal measurements agreed 0.01 feet on average. In November of 2011 the GNSS instruments and fixed height poles used in this survey were calibrated on the Santa Maria National Geodetic Survey Baseline and found to agree with published distances 0.003 to 0.006 feet.

To validate the radial survey method used in these surveys to position points from base stations AB61 and AB20, independent GNSS cross connections were measured and compared with the stand alone computed inverse distances in the 2007, 2008 and 2009 surveys. The results found the two dimensional accuracy to agree 0.01 feet on average, indicating the radial method of measurements is reliable and the additional labor cost of measuring cross connection between points is not warranted. See the "QAQC ANALYSIS" section of the September 2007 and the December 2008 Monitoring Survey Reports for detailed analysis.

Deflection Analysis is a method established by this surveyor to assess the consistency of the direction of movements reported from period to period. Assuming that movements are generally linear for points moving less than a ½ foot, the separation or the deflection between the direction of the previous and present periods taken over the moved distance implies the accuracy obtained with the equipment, methods and procedures. Analysis of individual deflections indicates that for points with multiple occupations the separations varied 0.01 to 0.02 feet.

SUMMARY

Prior to September 2007, successive coordinate differences were used to compute movements which do not provide statistical information about the relative movement accuracies. Beginning with the initial 2007 survey, field and office procedures were designed to assure the accuracy and reliability of measurements and provide for queries between epochs that include statistical information about the relative precisions of the reported movements. Thereafter, measurement of temporal movements are based on a rigorous simultaneous least squares adjustment of multiple observations at two different epochs for each point.

The results of the October 4, 2013 to September 19, 2014 monitoring period indicates the relative accuracy of the reported movements average 0.016 feet at the 95% Level of Confidence. Statistically, the probability at the 95% level of confidence is that movement (signal) has occurred at a point when the horizontal distance between two epochs is greater than the 95% Error (noise). See the "Movement Data Posting" for a listing of the 95% Error estimates (range 0.006 to 0.028 feet). Applying this criteria, 17 points have not moved.

Between October 4, 2013 to September 19, 2014 (11.5 months), points moved 0.02 to 1.65 feet and 4.6 feet for 4.5 months at PB67s in the Portuguese Bend Landslide (PB##), 0.01 to 0.06 feet in the Abalone Cove Landslide (AB##), and 0.01 to 0.05 in the Klondike Canyon (KC##). See the Contours of Horizontal Movement in the Appendix for a graphical representation of the movements.

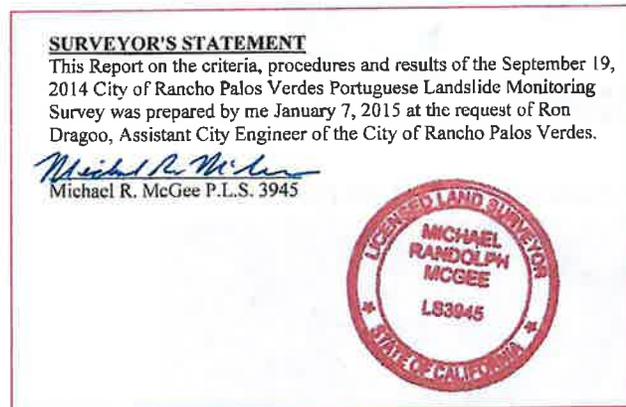

See the attached "MOVEMENT DATA POSTING" spreadsheet for overall and periodic movements of each point. The movements are given in north, east and up or down as well as a vector of distance and direction relative to north. The direction is given as an azimuth in degrees where 0° is north and increases clockwise (90° East, 180° South, 270° West). The overall movements are from the beginning position of each point which varies between 1994 and the present for newly established points.

The present listing and status of monitored points is provided in the Appendix under "Monitoring Point Status". The historical status of all monitoring points is provided in the September 2007 Survey Report. The historical 1994-2006 positions of all points are listed in the Charles Abbott Associates Inc. file "ALL POINTS MOST RECENT OBSERVED POSITION AS OF SEPTEMBER 15, 2006.xls" attached as an electronic file to the 2007 Report.

RECOMMENDATION

An ongoing re-location program for monuments has long term benefits resulting in better accuracy lower cost surveys due to improved sky visibility for tracking satellites. In this September 2014 survey, no monuments were re-located. Points AB16, AB24 and AB58 have limited sky visibility and should be re-located or deleted. AB12 is in a horse corral and has limited access

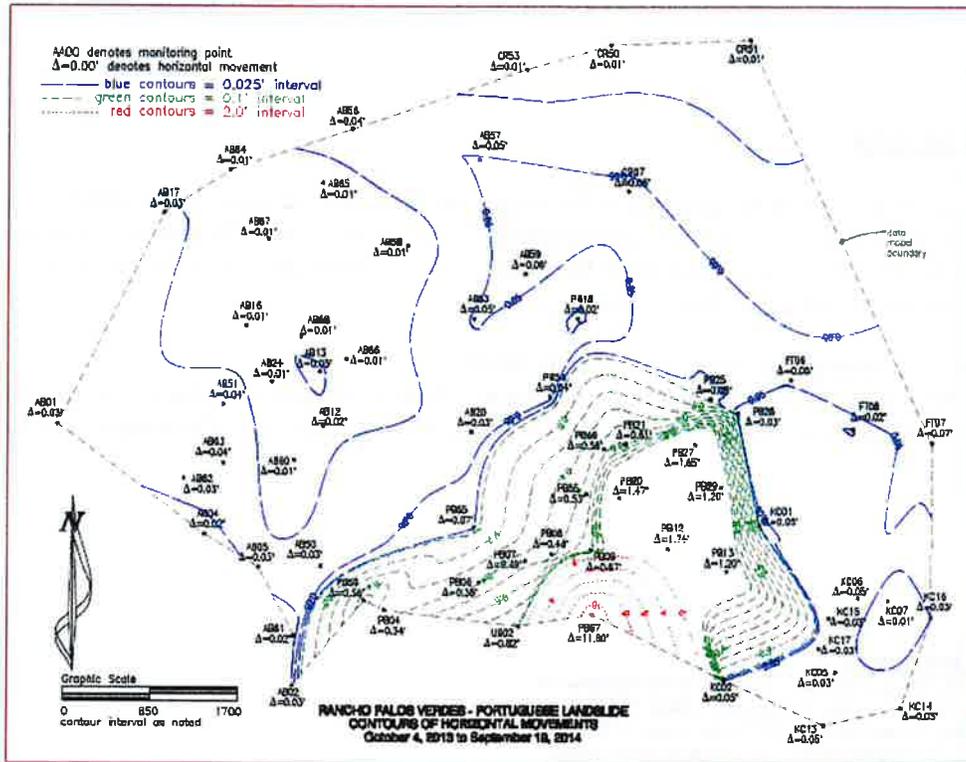

Attachments: The following document is attached to this Report.
"PB MOVEMENT DATA POSTING" lists the coordinates of the initial positions, the overall and periodic movements of monitoring point since 2007 and the NAD83(2007.00) State Plane Coordinates and NAVD88 Heights.

APPENDIX

First Addendum Report
February 7, 2015 Partial Monitoring Survey
Portuguese Bend Landslide
for the
City of Rancho Palos Verdes
by
McGee Surveying Consulting
February 12, 2015, Revised June 10, 2015

Overview:

This Addendum Report describes the first tri-annual partial monitoring survey in February 2015 at Portuguese Bend. This survey included a sub-set of 27 points of the full monitoring set and one temporary point AB69 set as a backup to AB12. This survey follows the procedures described in the above Report on the September 19, 2014 full monitoring. The detailed results of this survey are reported on Page 11 of the attached spreadsheet titled "PB MOVEMENT DATA POSTING 2007-2015.2" listing the coordinates, and periodic movements of points between September 19, 2014 and February 7, 2015 and the overall movement since 2007.

The movements reported between September 19, 2014 and February 7, 2015 (4.5 months) statistically attained an average accuracy of 0.012 feet at the 95% Level of Confidence as demonstrated by the measured vector residuals, repeatability of measurements at points considered stable, and the analysis of movement deflections. For a detailed history of the program and surveys see "History" above and previous Reports back to 2007. The field survey took place between February 6 and February 8, 2015. The Field Surveys, Equipment, Data Collection and Network Design were as described in the above Report. The survey included two onsite base stations and 26 onsite points each connected with two to six vectors. Three continuously operating GPS stations (CGPS) were connected to this survey with six vectors each. The Adjustments followed the process as described in the above Report with the following results.

Adjustment: Minimally Constrained Adjustment processed to develop NAD83 (2007) 2007.00 Epoch Geodetic, Ellipsoid and State Plane Coordinates in feet. CGPS Station PVE3 was fixed and the difference are listed in feet from the September 19, 2014 to the February 7, 2015 positions for the CGPS stations and points considered to mostly stable.

09/2014 Positions to 02/2015			
Station	dN	dE	dZ
AB17	-0.002	0.001	0.002
AB61	-0.005	-0.006	-0.019 <Base Station
CR50	-0.004	0.001	0.014
KC16	-0.007	-0.009	-0.013
KC17	-0.002	-0.008	0.002
PVE3	-0.000	-0.000	-0.000 < Fixed
PVRS	-0.009	-0.009	0.014

The adjustment was constrained as a standard procedure to the CGPS station PVE3 which finds CGPS station PVRS in agreement with the September 2014 horizontal position at 0.01 feet. AB61, AB17 and KC16 are historically stable and continue to be so. The survey reference frame was deemed stable and successfully recovered.

Summary of Movements: Between September 19, 2014 to the February 7, 2015 (4.5 months), points in this subset moved 0.03 to 3.36 feet in the Portuguese Bend Landslide (PB##), 0.03 to 0.07 feet in the Abalone Cove Landslide (AB##), and 0.02 feet in the Klondike Canyon (KC##). See the attached spreadsheet titled "PB MOVEMENT DATA POSTING 2007-2015.4" for the periodic movements of each point.

Second Addendum Report
April 16, 2015 Partial Monitoring Survey
Portuguese Bend Landslide
for the
City of Rancho Palos Verdes
by
McGee Surveying Consulting
June 10, 2015

Overview:

This Addendum Report describes the second tri-annual partial monitoring survey in April 2015 at Portuguese Bend. This survey included a sub-set of 27 points of the full monitoring set, temporary points AB69 set in February, temporary point AB70 set as a backup to AB12 which has challenging access in a horse corral, and three new points PB68, PB69 and PB70 set along PVDS. This survey followed the procedures described in the above September 19, 2014 full monitoring Report. The detailed results of this survey are reported on Page 12 of the attached spreadsheet titled "PB MOVEMENT DATA POSTING 2007-2015.4" listing the coordinates, and periodic movements of points between February 7 and April 17, 2015 and the overall movement since 2007.

The movements reported between February 7, 2015 and April 16, 2015 (2.3 months) statistically attained an average accuracy of 0.015 feet at the 95% Level of Confidence as demonstrated by the measured vector residuals, repeatability of measurements at points considered stable, and the analysis of movement deflections. For a detailed history of the program and surveys see "History" above and previous Reports back to 2007. The field survey took place between April 15 and April 18, 2015. The Field Surveys, Equipment, Data Collection and Network Design were as described in the above Report. The survey included two onsite base stations and 30 onsite points each connected with two to six vectors. Three continuously operating GPS stations (CGPS) were connected to this survey with seven vectors each. The Adjustments followed the process as described in the above Report with the following results. It is to be noted that solar activity was high during the survey resulting in somewhat noisy data collection.

Adjustment: Minimally Constrained Adjustment processed to develop NAD83 (2007) 2007.00 Epoch Geodetic, Ellipsoid and State Plane Coordinates in feet. CGPS Station PVE3 was fixed and the difference are listed in feet from the September 19, 2014 to the February 7, 2015 positions for the CGPS stations and points considered to mostly stable.

09/2014 Positions to 02/2015				
Station	dN	dE	dZ	
AB17	-0.014	-0.033	0.102	
AB50	-0.002	0.010	0.019	
AB61	0.002	0.013	0.008	Primary Base Station
CR50	0.014	0.002	0.072	
KC16	-0.000	0.022	0.023	
PVE3	-0.000	-0.000	-0.000	Fixed CGPS Station
PVRS	0.037	0.031	-0.029	CGPS Station
VTIS	0.003	0.017	0.024	CGPS Station

The adjustment was constrained as a standard procedure to the CGPS station PVE3 which finds CGPS station VTIS and the base station AB61 in agreement with the September 2014 and February 2015 position as expected. CGPS station PVRS is larger than expected and to be watched. The AB17 and KC16 historically don't move, however, AB17 has began to move based on the last several monitoring surveys. The survey reference frame was deemed stable and successfully recovered.

Summary of Movements: Between February 7, 2015 to April 16, 2014 (2.3 months), points in this subset moved 0.13 to 1.45 feet in the Portuguese Bend Landslide (PB##), and 0.03 to 0.04 feet in the Abalone Cove Landslide (AB##), 0.02-0.03 feet in the Klondike Canyon (KC##). See the attached spreadsheet titled "PB MOVEMENT DATA POSTING 2007-2015.4" for the periodic movements of each point. See the Table below for a condensed summary of movements and elevation changes.

PORTUGUESE BEND LANDSLIDE MONITORING - MOVEMENT DATA POSTING as of December 10, 2008

Prepared by McGehee Surveying Consulting
Fifth Annual Monitoring

Notes:

Indicates stable points, not moving

* Indicates no signal of horizontal movement detected in the last 6 weeks

2 = Hit by mover sometime between 09/07 and 12/08 with an estimated displacement S14E 0.39', the original position is

adjusted here to be relative to monitored position used presently, resulting in correct Overall Movements, see Rpt

PORTUGUESE HEND LANDSLIDE MONITORING - MOVEMENT DATA POSTING as of November 18, 2009

Prepared by McGehee Surveying Consulting
FULL ANNUAL MONITORING

Notes:

* Indicates stable points, not moving

* Indicates no signal of horizontal movement detected in the last period

Point	Nov. 18, 2009 Positions				Overall Movements (US Feet)						Periodic (11.3 months) Movements (US Feet)

PORTUGUESE BEND LANDSLIDE MONITORING - MOVEMENT DATA POSTING as of April 18, 2013
 Prepared by McGehee Surveying Consulting - Document Date: 09/30/2013 Revised 03/05/2014
 Monitoring Point Movements
 PASTIAL MID-YEAR MONITORING

Notes:
 * Indicates no signal of horizontal movement detected in the last period at the 95% level of confidence

by
McGee Surveying Consulting

PROJECT OVERVIEW:

McGee Surveying Consulting performed landslide monitoring and control surveys in October 2012 at Portuguese Bend in Los Angeles County, California on behalf of the City of Rancho Palos Verdes. The survey established positions on monitoring points to determine overall and periodic movements. The results of the survey are described in this Report and on an attached spreadsheet titled "Portuguese Bend Landslide Monitoring - Movement Data Posting" hereafter referred to as "Movement Data Posting".

The field survey was planned, coordinated and executed by Michael McGee, PLS3945 of McGee Surveying Consulting who was also responsible for the final processing of the observations, network adjustments, analysis and reports. The monitoring points cover a 1½ mile square area and are measured semi-annually to determine the rate and extent of ground movement. Global Navigation Satellite System (GNSS formerly referred to as GPS) technology was used to measure positions based on the North American Datum of 1983 (NAD83) and the North American Vertical Datum of 1988 (NAVD 88). This survey is referenced to the California CGPS (Continuous GPS) Stations in the region which are permanently mounted GPS receivers used for monitoring seismic activity. The CGPS in California are similar to the national CORS (Continuously Operated Reference Stations).

Points that move a few inches or less per year are required to meet an accuracy standard of one centimeter (0.033 feet) at the 95% Level of Confidence. In the active slide area where the movements exceed 0.5 feet per year (PB and UB points in the central area), the accuracy standard is two centimeters (0.066 feet). Field procedures are designed to accomplish this purpose and Quality Control-Quality Assurance (QAQC) processes discussed hereafter are incorporated to verify these accuracies are attained.

The movements reported between September 14, 2012 and October 4, 2013 (12.7 months) statistically attained an average accuracy of 0.02 feet at the 95% Level of Confidence. The actual accuracy of measurements held to the one centimeter standard are estimated to approach 0.01 feet as demonstrated by the vector residuals, repeatability of measurements at points considered stable, and the analysis of movement deflections. Refer to the sections titled ACCURACY and QAQC ANALYSIS in this Report for more information.

HISTORY

This monitoring survey is a continuation of a program initiated by the County of Los Angeles and taken over by the City of Rancho Palos Verdes circa 1994. McGee Surveying Consulting has conducted the field surveys and reporting since September 2007. See the September 2007 Survey Report for a history of the previous survey process between 1994 and 2007. See the subsequent annual Survey Reports for details of each monitoring campaign. Beginning with the 2012 rainy season (begins in September) full monitoring continued as usual and a partial monitoring was initiated in the spring.

PROJECT DATUMS, REFERENCE SYSTEM

Horizontal Datum: North American Datum of 1983 (NAD83) established by the National Geodetic Survey (NGS); **Epoch:** 2007.00 referred to as NAD83(2007); **Units:** Feet

Reference Network: The survey is referenced to the CGPS Stations (continuously operating GNSS receivers). For more information see NGS Data Sheets for the PID's listed below (no data sheet exists for PVE3). The positions listed below were obtained in September 2007 from the California Spatial Reference Center (CSRC). The CSRC provides CA Public Resources Code sanctioned positions for the California CGPS Stations.

CGPS	Latitude (dms)	Longitude (dms)	EH (feet)	NGS PID	NAME
PVE3	33 44 35.853290	-118 24 15.269036	235.42	none	PALOS VERDES CORS
PVHS*	33 46 46.020150	-118 22 19.741258	853.99	AJ1915	PENINSULA HIGH SCH
PVRS**	33 46 25.891904	-118 19 14.067218	198.63	AJ1916	PALOS VERDES RES
VTIS	33 42 45.489584	-118 17 37.712290	197.52	AJ1936	MARINE EXCHANGE

* Not Operational During Survey

** Falls in the proximity of a Fault Line as shown below but appears unaffected to date

CGPS Stations (north up)

Vertical Datum: North American Vertical Datum of 1988 (NAVD88) established by the NGS.
Geoid Model: Geoid 03; note Geoid09 became available from the NGS in 2009 and Geoid12A in 2012; however, Geoid03 is retained to be consistent with prior reported heights and the primary purpose of determining relative changes over time.

McGEE SURVEYING CONSULTING

Reference Network: CGPS Station VTIS is also a Second Order leveled benchmark and the original basis for the heights by this survey (see NGS Data Sheets for PID's listed above)

CGPS	NAVD88 Ht.(feet)	
PVE3	none	
PVHS	972.1	Based on a Refined Geoid Model
PVRS	316.37	Based on Second Order Leveling by CSRC
VTIS	315.26	Based on Second Order Leveling by CSRC and original basis for this survey

Projection: NAD83 California State Plane Coordinates Zone 5: The State Plane Coordinate Parameters follow: The average Scale Factor is 1.00007543, the Height Reduction Factor based on the average ellipsoid heights is 0.99999092, and the average Combined Grid Factor is 1.00006635. Distances in this survey are grid. To obtain ground distances divide grid distances by the Combined Grid Factor. Grid bearings resulting from this survey must be rotated by a Convergence Angle to obtain geodetic (true) bearings. The average convergence angle is -0-12-30± (rotate left 0-12-30).

Datum Stability: The NAD83(2007) Epoch 2007.00 adjustment is one of a series of adjustments of NAD83 since its adoption in 1986 and is the realization used for the monitoring surveys since 2007. Rancho Palos Verdes sits on the Pacific Plate which is moving west-northwesterly relative to the North American Plate about 4 centimeters (0.14 feet) per year. The area southwesterly of the Fault Line shown on the above map includes the City and is moving at a constant rate as exhibited by the ITRF08 N, E, Up velocities of the CGPS Stations listed below. These CGPS Stations provide a rigid reference frame for the Portuguese Bend Landslide Monitoring Program that is validated during each monitoring campaign. See the Adjustment results on Page 9 and the September 2007 Monitoring Survey Report by McGee Surveying Consulting for additional information.

Annual Velocities in Feet
Reference Epoch 2013.75

CGPS	North	East	Up
PVE3	0.084	-0.131	-0.002
PVHS	0.063	-0.130	-0.002
PVRS	0.062	-0.129	0.001
VTIS	0.064	-0.130	0.000

FIELD SURVEYS, DATA COLLECTION, EQUIPMENT & PROCESSING

Three Leica geodetic GNSS receivers/antennas listed below were mounted on two meter fixed height poles to collect and store satellite signal data. The GS15 receivers tracked Navstar GPS and GLONASS satellites. Prior to initiating the field observations a calibration of the fixed height poles was conducted with a theodolite to verify their heights and plumb. The top of the poles were found to be plumb within 0.003 feet of the bottom consistent with prior years. Additional checks were made each day. There were no equipment failures.

Sixty-five monitoring points were occupied and reported in this survey. Site photographs and recovery sheets detailing the location, character of the monuments and obstructions were updated. See the Appendix for "Monitoring Point Status for 2014. Monument AB61, established in September 2007 on Portuguese Bend, is used as the primary base station because it sits on a stable basalt formation. AB61ECC serves as a reference to AB61. AB20 serves as a secondary base for the survey.

The field survey commenced each day by setting a Leica GS15 GNSS receiver on a fixed height pole on AB61 and AB20 while a third GS15 GNSS receiver roamed freely collecting observations on a fixed height pole at the other 63 points. All points were measured with two independent occupations resulting in four measured vectors to each point from AB61 and AB20. On each day over a six day period, vectors based on 4-11 hours of observations connected AB61, AB20 and the CGPS stations. Sixteen points, in the active areas, with annual movements greater than 0.3' (PB and UB areas) were single occupied. A linear comparison was made with movements from prior years to verify their accuracy met the 0.07 foot (2 cm) requirement. All other points were occupied twice under a different constellation of satellites on a different day. If the two measurements were within 0.03 feet (1 cm) horizontally they were accepted, otherwise a third measurement was obtained.

McGEE SURVEYING CONSULTING

Many of the points are over-shadowed by mature trees and shrubberies which interfere with signals received from satellites and affect the quality of measurements. To obtain the best possible accuracies, the satellite constellation is compared with obstruction diagrams to estimate the best time for observing un-obstructed satellites. Satellites obstructed by foliage and trees are either turned off during the observation or noted for removal in post-processing. If six or more un-obstructed satellites with a GDOP (measure of the geometry of the constellation) of 4 or less are available, then the measurement commenced for a minimum of 15 minutes of data collection. If the geometry and number of satellites are insufficient then the receiver was moved to the next point and returned later when satellite availability improved.

Date of Survey: 10/01/13 to 10/06/13 (mean date 10/04/2013) between 0600-1800 PDST (+7 hrs for UTC).

GNSS Survey Parameters:

Constellation: 30 US NAVSTAR GPS satellites and 23 Russian GLONASS satellites.

Observables: GPS L1 & L2 Carrier Waves and Codes; GLONASS L1 & L2

Epoch Rate & Occupation Times: 10 seconds for 15 minutes and 4-11 hours for base stations

Satellites: 12-17; GDOP < 2.2; Elevation Mask for Data Collection 10° and Processing: 15°

Ephemeris: Rapid for Static Post-Processing for CGPS connections and Broadcast for onsite.

Weather: Generally clear skies, temperature 63°-91° F.

Space Weather: Boulder K Index was 1-3 except it reached 5 in the afternoon of 10/02/13 (gauges ionospheric activity on a scale of 0-9, <5 preferred).

Equipment:

GNSS Base Receiver Unit No.: M5, Operator: M. McGee, PLS; Station Occupied: AB61 (Base1)

Make & Model: Leica GS15; Antenna Leica GS15; Mount: Fixed Height Pole #1; Antenna Height: 1.803m

GNSS Rover Receiver Unit No.: M6, Operator: M. McGee, PLS;

Make & Model: Leica GS15; Antenna Leica GS15; Mount: Fixed Height Pole #3; Antenna Height: 1.800m

GNSS Rover Receiver Unit No.: M7, Operator: M. McGee, PLS, Station Occupied: AB20 (Base2)

Make & Model: Leica GS15; Antenna Leica GS15; Mount: Fixed Height Pole #2; Antenna Height: 1.803m

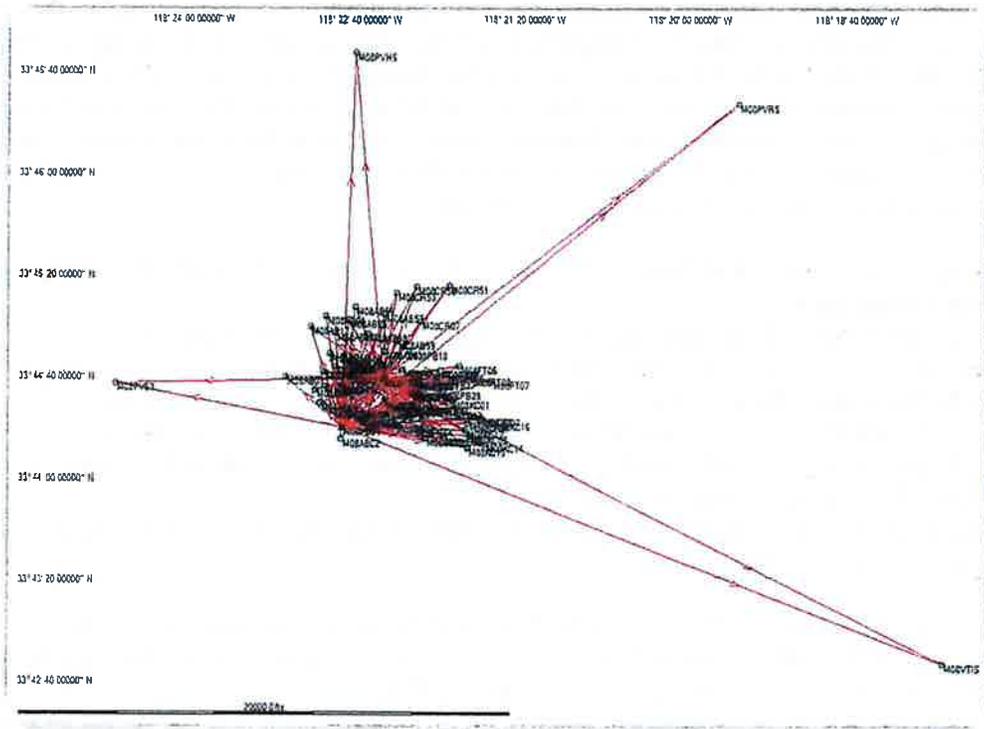

Vectors were processed using Leica LGO v8.1 post processing software. Analysis of residuals led to the rejection of 3 out of 50 vectors connecting the CGPS Stations to AB61 and AB20, and 10 out of 226 vectors connecting monitoring points. Network adjustments and analysis were performed with "Starnet-PRO" version 7.2.0.21 software. Rinex files of the satellite measurements for the CGPS Stations were downloaded from the SOPAC website. The Rapid Ephemeris and Absolute Antenna Models were downloaded from the NGS website.

NETWORK

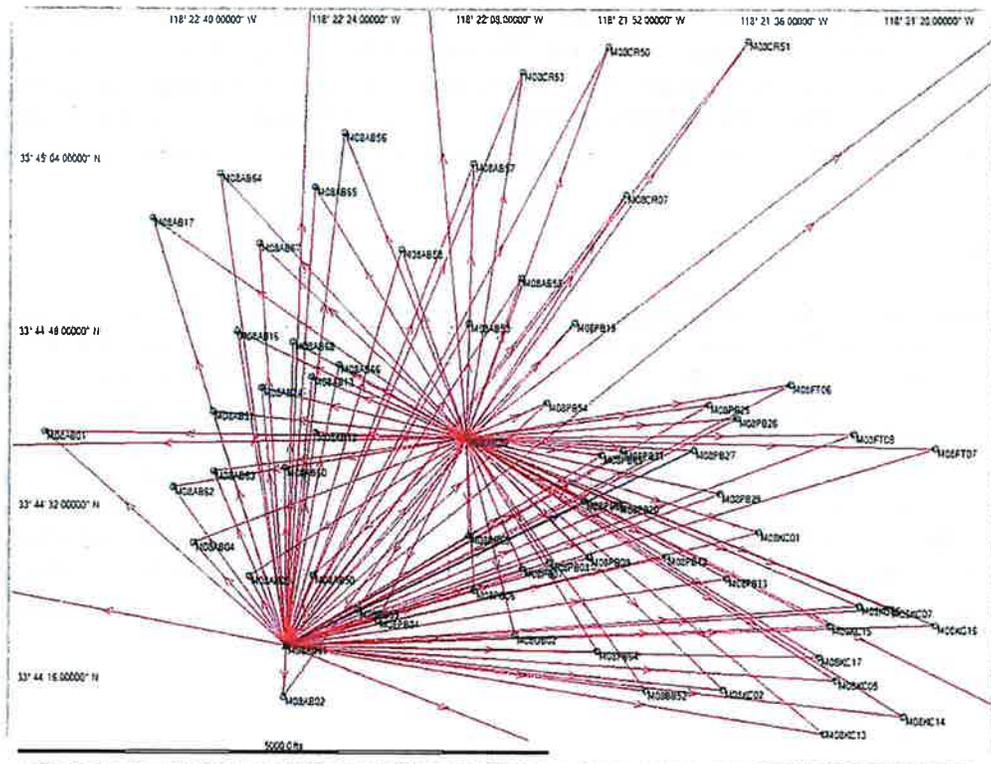

AB61, the primary Base Station, sits on Portuguese Bend and is the focal point of the static network connecting the monitoring points and CGPS Stations. AB20, the secondary Base Station is centrally located sitting on top of a high bluff overlooking Portuguese Bend. Sixty-five points and four CGPS Stations were connected with 263 redundant vectors. See the following Network Maps and the Aerial View in the Appendix.

The monitoring plan uses the CGPS Stations to verify the stability of the reference frame. The primary CGPS Station used to control this survey is PVE3 located just south of City Hall and 1.8 miles west-northwest of the Base Station AB61. CGPS Station PVHS is 2.8 miles north, PVRS is 3.9 miles northeast, and VTIS is 4.9 miles east-southeast of AB61, as shown on the Network diagram, are used to validate the stability of the network.

Monitoring Network with CGPS Stations (north up)

Monitoring Network (north up)

MONITORING POINT HISTORY and STATUS

For data management purposes during the field survey and data processing, the point names were prefixed with "M08" to distinguish between the different monitoring surveys i.e. AB61 was named M08AB61. M08 indicates this survey is the 8th monitoring since the initial September 2007 Monitoring Survey. The prefix is stripped in the COORDINATES LIST and MOVEMENT DATA POSTING.

Between 1994 and 2006, 149 monitoring points were established to monitor the Portuguese Bend Landslides, many of which were lost or destroyed. Sixty of the original points were recovered in 2007. Eight of the 60 points were deleted because they were in close proximity of other points better suited for GNSS satellite measurements leaving 52 points monitored and reported between September 2006 and September 2007. Three of the 52 points (AB09, KC11, PB51) were monitored in September 2007 for the last time because they were replaced by new points, set nearby and better suited for satellite observations. Eighteen new points were set in 2007 and had their movements reported for the first time in the following December 2008 survey. Therefore, in December 2008, 49 original and 18 new points were surveyed for a total of 67 monitoring points.

In the September 2007 Report, it was noted that KC01 was previously reported by others on 9/14/2006 to have moved N 29°E 1.24' from its 12/9/2005 position. In the 2008 survey, a buried partially illegible brass cap in concrete stamped "COUNTY ENGINEER RE8869 1956 STA ??IELDS" was found S31°29'W 1.48 feet from the 1" IP was used in the initial September 2007 and subsequent surveys. The original 1994 position of KC01 was re-referenced to the 1" IP, resulting in correct overall reported movements.

In the December 2008 Report, it was noted that AB05 had been disturbed by a mowing machine. AB05 was found chipped and leaning to southerly about 0.4'. The movement reporting resumed in 2009. Analysis of the movement and historic data made it possible to estimate the disturbance to within 0.05'. The original 1995 position of AB05 was re-referenced S14°02'E 0.29' to be consistent with the disturbed position, resulting in correct overall reported movements.

In 2009, PB64 was set east of the Archery Range to replace PB63 (set 2007) which had become unsafe to access and was lost in 2010.

In 2010, points AB03 and BB25 were discontinued. AB03 is on the edge of a cliff 192 feet west-southwest of AB61 making it redundant, and BB25 is on an unstable rock disturbed by wave action. In the summer of 2010, PB62 was destroyed by road construction. In October 2010, PB65 was set 24' south-southwest of PB62 and reported for the first time in October 2011. The following points may have been disturbed prior to the October 2010 survey. AB05 appears to have been disturbed by mower machinery, AB15 (½" GIP in a meter box) is being driven over by vehicles occasionally accessing an adjacent field, and KC02 (½" GIP in a meter box) is occasionally parked on by vehicles accessing the beach.

In October 2011, new points AB62 and AB63 (initially referred to as AB62R and AB63R) were set to replace AB06 and AB07 which were hazardous to occupy due to their location near the traveled way of Palos Verde Drive South.

Prior to initiating the September 2012 survey, eight new monuments AB64, AB65, AB66, AB67, AB68, CR53, KC17 and PB66 were constructed to replace AB54, AB18, AB52, AB55, AB15, CR52, KC04 and PB53 respectively. The monuments were replaced because of poor sky visibility except for KC04 which was difficult to access and AB55 which was destroyed by trenching in the past year. Monuments were set with the following design. Monuments set in soil are 1" x 5' GIP driven flush with a 6" PVC pipe sitting on a concrete collar down about 18". Monuments set in asphalt are 1/2" x 2' rebar driven below the surface inside a free floating concrete collar.

In September 2012 points AB15, AB18, AB52, AB54, CR52, KC04 and PB53 were surveyed for the last time and discontinued in October 2013. In April 2014 point PB64 was surveyed for the last time and PB67 (a 5' t-bar steel post driven 3' into the ground) was set as a replacement about 300' northerly to be reported in the fall 2014 survey. See the "Monitoring Point Status for 2014 Prepared December 17, 2013" for the present status of monitoring points in the Appendix.

ADJUSTMENTS & ANALYSIS

Adjustment 1: Minimally Constrained Adjustment processed to develop NAD83 (2007) 2007.00 Epoch Geodetic, Ellipsoid and State Plane Coordinates.

Fixed Control: CGPS Station PVE3 was fixed at its published NAD83 (2007) position in a Minimally Constrained Adjustment to determine positions and verify its stability relative to other CGPS stations. PVE3 is located 2 miles west of and outside the influence of the slide area. PVE3 has been fixed in all adjustments since 2007. The CSRC publishes a Time Series for the horizontal and vertical stability of PVE3 which indicate the position has been stable since 2007. The primary base station AB61 and three other CGPS Stations were measured relative to PVE3 and used to assess stability of the survey reference frame. The positions are based on 4 to 11 hour measurements collected on six consecutive days. The coordinate differences at the CGPS Stations from previous positions to the present are listed below in feet.

09/2012 Positions to 10/2013					9/2007 Positions to 09/2012			
Station	dN	dE	dZ		Station	dN	dE	dZ
PVE3	0.000	0.000	0.000	< Fixed >	PVE3	0.000	0.000	0.000
PVHS*	0.002	0.000	0.005					
PVRS	0.003	0.008	-0.052		PVRS	-0.003	0.013	0.039
VTIS	0.004	0.007	-0.069		VTIS	-0.009	0.004	0.012
AB61	-0.007	0.002	-0.034	<Base Station>	AB61	-0.011	0.006	-0.015
AB17	0.005	-0.012	0.013					
KC16	0.008	0.009	0.014					

* The position for PVHS is from November 2009.

The following is noted: (1) the two dimensional (2D) differences in the measured positions of the September 14, 2012 and October 4, 2013 of the three CGPS Stations range 0.002 to 0.008 feet and 0.007 feet at AB61; (2) the 2D differences of the CGPS Stations from the initial 2007 survey to the September 2012 survey range 0.010 to 0.013 feet and 0.012 feet at AB61; and (3) points AB17 and KC16 have a stable history when comparing their 2007 positions with this survey indicating a repeatability of approximately 0.01 feet as listed in the attached "MOVEMENT DATA POSTING". The vertical components are within 0.014 feet.

The vertical differences at PVRS and VTIS are larger than expected; however, AB17 and KC16 checks 0.014 feet indicating the vertical reference frame has been recovered on site. Equipment changes have occurred at the CGPS stations in the last year and may have contributed to the differences noted. At the next monitoring this issue will be investigated further.

The survey reference frame is deemed stable and successfully recovered at the level of 0.01 feet horizontally by 0.02 feet vertically as indicated. An adjustment constrained to the CGPS Stations is not preferred or necessary because the purpose here is to track their positions over time to test the stability of the reference frame. See the "COORDINATE LIST – October 4, 2013" in the Appendix for a list of coordinates resulting from this adjustment. See prior Survey Reports for coordinates resulting from earlier surveys.

Adjustment 2: Minimally Constrained Adjustment to develop Orthometric Heights (Elevations) in NAVD88

Fixed Control: The CGPS Station PVE3 was fixed horizontally and vertically at its NAVD88 orthometric height determined in the September 2007 survey. The 2007 height was based on the published 2nd Order NAVD88 Height of CGPS Station VTIS. This Adjustment combined the measured ellipsoid height differences with the NGS Geoid 03 (models the separation between the ellipsoid and geoid surfaces) to determine NAVD88

McGEE SURVEYING CONSULTING

orthometric heights of the other CGPS Stations and the monitoring points. The differences for the CGPS stations from the previous survey to the heights determined in the present survey are listed below in feet.

09/2012 to 10/2013		10/2011 to 09/2012	
PVE3	-0.000 Fixed	PVE3	0.000 Fixed
PVHS	0.005		
PVRS	-0.052	PVRS	0.015
VTIS	-0.069	VTIS	-0.005

Note: As noted above the vertical differences at PVRS and VTIS will be investigated in the next monitoring; however, the differences at AB17 and KC16 verify the accuracy on site is at the level of 0.014 feet. See the “COORDINATE LIST – October 4, 2013” Survey” in the Appendix for a list of heights resulting from this survey.

ACCURACY

These surveys conform to the intent of the Federal Geodetic Control Subcommittee (FGCS) “Specifications for GPS Relative Positioning” (1988) and the California Geodetic Control Committee (CGCC) “Specifications for High-Production GPS Surveying Techniques” (1993).

Vectors & Residuals: The number of vectors, vector lengths, two dimensional residuals and the absolute value of the vertical residuals resulting from Adjustment #1 are listed below in feet.

Network	No.	Vector Lengths		Two Dimensional Residuals			Vertical Residuals (absolute)		
		Vary	Average	Average	Std.Dev.	Maximum	Average	Std.Dev.	Range
Monitoring	216	479-7182	3168	0.008	0.005	0.029	0.013	0.013	-0.09 to +0.05
CGPS	47	9397-26102	18031	0.011	0.007	0.029	0.031	0.022	-0.09 to +0.07

Local Accuracy: The precisions and accuracy of vectors resulting from the minimally constrained adjustment at the 95% Level of Confidence are listed below in feet.

Network	PPM Precisions	Relative Distance Error		
	Average	Average	Maximum	Av. Precision
Monitoring	8.5 ppm	0.019	0.066	1: 167,000
CGPS	0.4 ppm	0.005	0.007	1:3,606,000

The precision ratio, based on the averages for all vectors connecting the Monitoring Points, exceeds the criteria for a First Order (C-1) by a factor of 1.7. The precision ratio for vectors connecting AB61, AB20 and the CGPS Stations exceeds the criteria for a B Order survey by a factor of 3.6 per the FGCS requirements for the former classification system.

Coordinate Accuracy: The Standard Deviations (68% Level of Confidence) of the coordinates derived from Adjustment #1, relative to the CGPS Station PVE3 follow in feet.

	Monitoring Point			CGPS Stations		
	North	East	Up	North	East	Up
Average Standard Deviation	0.008	0.008	0.036	0.003	0.003	0.010
Maximum Standard Deviation	0.021	0.024	0.101	0.003	0.004	0.012

Network Accuracy: The network accuracy (absolute accuracy) is expected to be less than 0.02 feet horizontal relative to the NAD83 Datum based on the CGPS Station PVE3 fixed in Adjustment #1.

NAVD88 Heights: The North American Vertical Datum of 1988 orthometric heights resulting from Adjustment #2 are derived from the difference in ellipsoid heights combined with the Geoid 03 model and constrained to the height of PVE3 determined in 2007. The measured ellipsoid heights relative to PVE3 are expected to be less than 0.04 feet but may be greater at obstructed sites. The absolute accuracy of the heights relative to the datum is dependent on the published value on the CGPS Station VTIS.

Although relative elevation accuracies can be within 0.03 feet, up until October 2011 there were no requirements for vertical accuracies. In October 2011, a preference of 0.03 foot relative vertical accuracy was instigated for the following points: AB17, AB57, CR07, CR50 and CR51. In the September 2012 and subsequent surveys the criteria has been extended to all points.

Movement Accuracy: For this period, 49 points moved less than 0.30 feet with an average of 0.05 feet. The relative error at the 95% Level of Confidence averaged 0.020 feet with a standard deviation of 0.008 feet and a range of 0.005 to 0.054 feet. Overall, the estimated relative movement error averaged 0.022 feet with a standard deviation of 0.009 feet and a range of 0.005 to 0.054 feet. No movement is considered detected unless the movement exceeds the 95% Error for individual points. See Page 8 of the attached "MOVEMENT DATA POSTING" for the estimated relative movement errors at the 95% Level of Confidence for individual points for the period.

QUALITY CONTROL - QUALITY ASSURANCE (QAQC) ANALYSIS

To ensure the accuracy and validity of the measurement systems used in these GNSS monitoring surveys, an independent test was made using conventional terrestrial based instruments as reported in the "QAQC ANALYSIS" section of the September 2007 Monitoring Survey Report. Comparing the results of the GNSS systems with conventional instrumentation found horizontal measurements agreed 0.01 feet on average. In November of 2011 the GNSS instruments and fixed height poles used in this survey were calibrated on the Santa Maria National Geodetic Survey Baseline and found to agree with published distances 0.003 to 0.006 feet.

To validate the radial survey method used in these surveys to position points from base stations AB61 and AB20, independent GNSS cross connections were measured and compared with the stand alone computed inverse distances in the 2007, 2008 and 2009 surveys. The results found the two dimensional accuracy to agree 0.01 feet on average, indicating the radial method of measurements is reliable and the additional labor cost of measuring cross connection between points is not warranted. See the "QAQC ANALYSIS" section of the September 2007 and the December 2008 Monitoring Survey Reports for detailed analysis.

Deflection Analysis is a method established by this surveyor to assess the consistency of the direction of movements reported from period to period. Assuming that movements are generally linear for points moving less than a ½ foot, the separation or the deflection between the direction of the previous and present periods taken over the moved distance implies the accuracy obtained with the equipment, methods and procedures. Analysis of individual deflections indicates that for points with multiple occupations the separations varied 0.01 to 0.02 feet.

SUMMARY

Prior to September 2007, successive coordinate differences were used to compute movements which did not provide statistical information about the relative movement accuracies. Beginning with the initial 2007 survey, field and office procedures were designed to assure the accuracy and reliability of measurements and provide for queries between epochs that include statistical information about the relative precisions of the reported movements. Thereafter, measurement of temporal movements are based on a rigorous simultaneous least squares adjustment of multiple observations at two different epochs for each point.

The results of the September 14, 2012 to October 4, 2013 monitoring period indicates the relative accuracy of the reported movements average 0.022 feet at the 95% Level of Confidence. Statistically, the probability at the 95% level of confidence is that movement (signal) has occurred at a point when the horizontal distance between two epochs is greater than the 95% Error (noise). See the "Movement Data Posting" for a listing of the 95% Error estimates (range 0.005 to 0.054 feet). Applying this criteria, 17 points have not moved.

McGEE SURVEYING CONSULTING

Between September 14, 2012 and October 4, 2013 (12.7 months), the differences reported in the Portuguese Bend Landslide (PB points) were 0.10 to 25.81 feet; in the Abalone Cove Landslide (AB points) west of the Portuguese Bend Landslide were 0.01 to 0.10 feet; and in the Klondike Canyon (KC points) east of the Portuguese Bend Landslide were 0.01 and 0.09 feet. See the Contours of Horizontal Movement in the Appendix for a graphical representation of the movements across the site.

See the attached "MOVEMENT DATA POSTING" spreadsheet for overall and periodic movements of each point. The movements are given in north, east and up or down as well as a vector of distance and direction relative to north. The direction is given as an azimuth in degrees where 0° is north and increases clockwise (90° East, 180° South, 270° West). The overall movements are from the beginning position of each point which varies between 1994 and 2012.

The present listing and status of monitored points is provided in the Appendix under "Monitoring Point Status for 2014 Prepared 12/17/2013". The historical status of all monitoring points is provided in the September 2007 Survey Report. The historical 1994-2006 positions of all points are listed in the Charles Abbott Associates Inc. file "ALL POINTS MOST RECENT OBSERVED POSITION AS OF SEPTEMBER 15, 2006.xls" attached as an electronic file to the 2007 Report.

RECOMMENDATION

An ongoing re-location program for monuments has long term benefits resulting in better accuracy lower cost surveys due to improved sky visibility for tracking satellites. In this October 2013 survey, no monuments were re-located. Points AB16, AB24 and AB58 are becoming increasingly blocked by trees and should be considered for deletion or re-location in 2014. PB64 is in a precarious location and may not be accessible in 2014. In 2011, a program was proposed to set or replace monitoring points with deep set monuments (as much as 10 feet) to better detect sub-surface movements.

Attachment: The document "PORTUGUESE BEND LANDSLIDE MONITORING - MOVEMENT DATA POSTING" is attached to this Report and lists the coordinates, overall and periodic movements of monitoring point since 2007.

SURVEYOR'S STATEMENT

This Report on the criteria, procedures and results of the October 4, 2013 City of Rancho Palos Verdes Portuguese Landslide Monitoring Survey was prepared by me March 12, 2014 at the request of Ron Drago, Assistant City Engineer of the City of Rancho Palos Verdes.

Michael R. McGee P.L.S. 3945

Portuguese Bend Landslide

April 7, 2014 Partial Monitoring Survey Addendum Report

Revised May 24, 2014

for the

City of Rancho Palos Verdes

by

McGee Surveying Consulting

Overview:

This Addendum Report describes a mid-year partial monitoring survey of a sub-set of 27 points in April 2014 at Portuguese Bend. This survey follows the procedures described in the above Report on the October 4, 2013 full monitoring. The results of this survey are reported on Page 9 of the attached spreadsheet titled “PORTUGUESE BEND LANDSLIDE MONITORING - MOVEMENT DATA POSTING” listing the coordinates, overall and periodic movements of points.

The movements reported between October 4, 2013 and April 7, 2014 (6.0 months) statistically attained an overall average accuracy of 0.02 feet at the 95% Level of Confidence as demonstrated by the measured vector residuals, repeatability of measurements at points considered stable, and the analysis of movement deflections. For a detailed history of the program and surveys see “History” above. The field survey took place April 6-9, 2014. The Field Surveys, Equipment, Data Collection and Network Design were as described in the above Report. The survey included 28 on site points and 3 CGPS Stations each connected with two to seven vectors. In April 2014 point PB64 was surveyed for the last time and PB67 (a 5’ t-bar steel post driven 3’ into the ground) was set as a replacement about 300’ northerly to be reported in the fall 2014 survey.

The Adjustments followed the process as described in the above report with the following results.

Adjustment: Minimally Constrained Adjustment processed to develop NAD83 (2007) 2007.00 Epoch Geodetic, Ellipsoid and State Plane Coordinates in feet. CGPS Station PVE3 was fixed and the difference are listed in feet from the October 4, 2013 positions to the CGPS stations and points considered to mostly stable.

10/2013 Positions to 04/2014			
Station	dN	dE	dZ
AB17	0.016	-0.002	0.061
AB61	0.002	-0.002	0.023
CR50	0.021	-0.001	0.111
KC16	0.001	-0.010	-0.014
PVE3	-0.000	-0.000	-0.000
PVRS	-0.017	0.004	0.014
VTIS	-0.020	0.007	0.121

<Base Station

< Fixed

The adjustment was constrained as a standard procedure to the CGPS (continuous GPS) station PVE3 which finds CGPS stations PVRS and VTIS in agreement with the October 2013 positions at 0.02 feet. Previous surveys general have been in agreement less than 0.01 feet; however, the satellite data collected at these stations was noisy during this survey resulting in less precise solutions. SOPAC and the USGS are investigating the issue. AB61, AB17 and KC16 are historically stable and continue to be so. The survey reference frame was deemed stable and successfully recovered. The plus vertical differences at AB17, CR50 and others listed in the “MOVEMENT DATA POSTING” are unexpected; however, redundant survey measurements agree at 0.01 to 0.02 feet and all indications are the relative accuracy is 0.03 feet.

Summary of Movements: Between October 4, 2013 and April 7, 2014 (6.0 months) points in the Portuguese Bend Landslide (PB points) moved 0.03 to 16.69 feet; points in the Abalone Cove Landslide (AB points) west of the Portuguese Bend Landslide moved 0.02 to 0.04 feet; and points in the Klondike Canyon (KC points) east of the Portuguese Bend Landslide moved 0.03 and 0.16 feet.

PORTUGUESE BEND LANDSLIDE MONITORING - MOVEMENT DATA POSTING as of September 24, 2007

Prepared by McGee Surveying Consulting

MONITORING POINTS

NAD83 (2007) STATE PLANE COORDINATES & NAVD88 ELEVATIONS of Original Positions, 2007 & Post 2007 Positions

Notes # Indicates stable points, not moving

* Indicates no signal of horizontal movement detected in the last period at the 95% level of confidence

1- 2005 and prior surveys used a nearby monument S31-29W 1.48', the original position is adjusted here to be relative to the 1" IP used presently, resulting in correct Overall Movements, see Reports

9/24/2007 (1994) Indicates the 2007 position was used for overall; see the 2011 Report for original 1994 positions

PORTUGUESE BEND LANDSLIDE MONITORING - MOVEMENT DATA POSTING as of December 10, 2008

Prepared by McGee Surveying Consulting

FULL ANNUAL MONITORING

Notes:

Indicates stable points, not moving

* Indicates no signal of horizontal movement detected in the last period

z = Hit by mowser sometime between 09/07 and 12/08 with an estimated displacement Si4E 0.29', the original position is adjusted here to be relative to monitored position used presently, resulting in correct Overall Movements, see Rpt

Point	Dec. 10, 2008 Position			Overall Movements (US Feet)						Periodic (14.5 months) Movements (US Feet)

PORTUGUESE BEND LANDSLIDE MONITORING - MOVEMENT DATA POSTING as of November 18, 2009

Prepared by McGee Surveying Consulting

FULL ANNUAL MONITORING

Notes:

Indicates stable points, not moving

* Indicates no signal of horizontal movement detected in the last period

Point	Nov. 18, 2009 Positions			Overall Movements (US Feet)						Periodic (11.3 months) Movements (US Feet)

PORTUGUESE BEND LANDSLIDE MONITORING - MOVEMENT DATA POSTING as of April 7, 2014
 Prepared by McGee Surveying Consulting - Document date: 05/14/2014
 Monitoring Point Movements
 PARTIAL MID-YEAR MONITORING

Notes:

* Indicates no signal of horizontal movement detected in the last period at the 95% level of confidence

Survey Report
for the
Portuguese Landslide Monitoring Survey
September 14, 2012
(See Page 16 for the April 18, 2013 Partial Monitoring)
for the
City of Rancho Palos Verdes
by
McGee Surveying Consulting

Client: City of Rancho Palos Verdes;

Surveyed by: McGee Surveying Consulting

Project Name: Portuguese Bend Landslide Monitoring Program

Location: City of Rancho Palos Verdes, California; **County:** Los Angeles; **State:** California

PROJECT OVERVIEW:

On behalf of the City of Rancho Palos Verdes, McGee Surveying Consulting performed slide monitoring and control surveys at Portuguese Bend in September 2012 and a partial monitoring in April 2013. The purpose of the survey was to establish accurate positions on monitoring points to determine overall and periodic movements. The results of the survey are described in this Report and reported on attached spreadsheets titled "Full Data Posting". The April 2013 partial monitoring is addressed at the end of this Report.

The field survey was planned, coordinated and executed by Michael McGee, PLS3945 of McGee Surveying Consulting. Michael McGee, PLS is responsible for the final processing of the observations, network adjustments, analysis and reports. The monitoring points cover approximately a 1½ mile square area and are measured annually or more often as necessary to determine the rate and extent of ground movement. Global Navigation Satellite System (GNSS formerly referred to as GPS) technology was used to measure positions based on the North American Datum of 1983 (NAD83) and the North American Vertical Datum of 1988 (NAVD 88). This survey is referenced to the California CGPS (Continuous GPS) Stations in the region which are permanently mounted GNSS receivers used for monitoring seismic activity. The CGPS in California are similar to the national CORS (Continuously Operated Reference Stations).

Many of the points move a few inches or less per year; therefore, the requirement is to meet an accuracy standard of one centimeter (0.033 feet) at the 95% Level of Confidence. In the active slide area where the movements approach a foot or more per year (PB and UB points in the central portion), the accuracy standard is two centimeters (0.066 feet). Field procedures are designed to accomplish this purpose and Quality Control-Quality Assurance (QAQC) processes discussed hereafter are incorporated to verify these accuracies are attained.

The movements reported between October 3, 2011 and September 14, 2012 (11.4 months) statistically attained an overall average accuracy of 0.027 feet at the 95% Level of Confidence. The actual accuracies of these measurements is estimated to be 0.02 feet as demonstrated by the measured vector residuals, repeatability of measurements at points considered stable, and the analysis of movement deflections. Refer to the sections titled ACCURACY, DEFLECTION ANALYSIS and SUMMARY at the end of this Report for more information.

HISTORY

This survey is a continuation of a monitoring survey program initiated by the County of Los Angeles and taken over by the City of Rancho Palos Verdes circa 1994. McGee Surveying Consulting has conducted the field surveys and reporting since September 2007. See the September 2007 Survey Report for a history of the previous survey process between 1994 and 2007. See the subsequent Survey Reports for the December 2008, November 2009, October 2010 and October 2011 campaigns.

PROJECT DATUMS, REFERENCE SYSTEM

Horizontal Datum: North American Datum of 1983 (NAD83) established by the National Geodetic Survey (NGS); **Epoch:** 2007.00 referred to as NAD83(2007).; **Units:** Feet

Reference Network: The survey is referenced to the CGPS Stations (continuously operating GNSS receivers) mounted on a stable platform. For more information see NGS Data Sheets for the PID's listed below (no data sheet exists for PVE3). The positions listed below were obtained in September 2007 from the California Spatial Reference Center (CSRC). The CSRC provides CA Public resources Code sanctioned positions for the California CGPS Stations.

CGPS	Latitude (dms)	Longitude (dms)	EH (feet)	NGS PID	NAME
PVE3	33 44 35.853290	-118 24 15.269036	235.42	none	PALOS VERDES CORS
PVHS*	33 46 46.020150	-118 22 19.741258	853.99	AJ1915	PENINSULA HIGH SCH
PVRS**	33 46 25.891904	-118 19 14.067218	198.63	AJ1916	PALOS VERDES RES
VTIS	33 42 45.489584	-118 17 37.712290	197.52	AJ1936	MARINE EXCHANGE

* Station not operating during this survey

** Falls in the proximity of a Fault Line as shown below but appears unaffected to date

McGEE SURVEYING CONSULTING

Vertical Datum: North American Vertical Datum of 1988 (NAVD88) established by the NGS
Geoid Model: Geoid 03; note Geoid09 became available from the NGS in 2009 and Geoid12A in 2012; however, Geoid03 is retained to be consistent with prior reported heights and the primary purpose of determining relative changes over time.

Reference Network: CGPS Station VTIS is also a Second Order leveled benchmark and the original basis for the heights by this survey (see NGS Data Sheets, PID's listed above)

CGPS	NAVD 88 Ht (feet)	
PVE3	none	
PVHS	972.1	Based on a Refined Geoid Model
PVRS	316.37	Based on Second Order Leveling by CSRC
VTIS	315.26	Based on Second Order Leveling by CSRC and original basis for this survey

Projection: NAD83 California State Plane Coordinates Zone 5: The State Plane Coordinate Parameters follow. The average Scale Factor is 1.00007543, the Ellipsoid Height Reduction Factor based on the average ellipsoid heights is 0.99999092, and the average Combined Grid Factor is 1.00006635. Distances in this survey are grid. To obtain ground distances divide grid distances by the Combined Grid Factor. Grid bearings resulting from this survey must be rotated by a Convergence Angle to obtain geodetic (true) bearings. The average convergence angle is -0-12-30± (rotate left 0-12-30).

Datum Stability: The NAD83(2007), 2007.00 Epoch adjustment is one of a series of adjustments of NAD83 since its adoption in 1986 and is the datum used for the monitoring surveys since 2007. Rancho Palos Verdes sits on the Pacific Plate which is moving west-northwesterly relative to the North American Plate about 4 centimeters (0.14 feet) per year. The area southwesterly of the Fault Line shown on the above map includes the City and is moving at a constant rate as exhibited by the N, E, Up velocities of the CGPS Stations listed below. These CGPS Stations provide a rigid reference frame for the Portuguese Landslide Monitoring Program that is validated during each monitoring campaign. See the Adjustment results on Page 8 and the September 2007 Monitoring Survey Report by McGee Surveying Consulting for additional information.

Annual Velocities in Feet
Reference Epoch 2012.7

CGPS	North	East	Up
PVE3	0.061	-0.134	-0.004
PVHS	0.059	-0.130	-0.007
PVRS	0.057	-0.131	0.001
VTIS	0.061	-0.131	-0.004

FIELD SURVEYS, DATA COLLECTION, EQUIPMENT & PROCESSING

72 monitoring points were occupied and reported in this survey. Site photographs and recovery sheets detailing the location, character of the monuments and obstructions were updated. See the Appendix for "Monitoring Point Status for 2013 Prepared 12/09/2012"

Monument AB61 was established in September 2007 on Portuguese Point and is used as the primary base station for Monitoring Surveys. The location is secured behind a locked gate, has a mostly clear horizon above 10 degrees, and sits on a stable basalt geological formation. A 5/8" x 2' rebar with a plastic cap and tack named "AB61ECC" was set for a reference monument on 10/23/2010 to test the local stability of AB61.

The field survey commenced each day by setting a GNSS receiver on a fixed height pole on AB61 and AB20 while a GNSS receiver roamed freely collecting observations on a fixed height pole at 71 points. This results in two measured vectors to each point. Beginning this year, points in the active central area with annual movements greater than 0.3' (PB and UB areas) were occupied a single time and a linear comparison was made with movements from prior years to verify the accuracy meets the 0.07 foot requirement. Otherwise, all other points were occupied twice under a different constellation of satellites on a different day. If the two measurements were within 0.03 feet they were accepted, otherwise a third measurement was obtained.

Many of the points are over-shadowed by mature trees and shrubberies which interfere with signals received from satellites and can affect the quality of measurements. To obtain the best possible accuracies, the satellite constellation is compared with obstruction diagrams to estimate the best time for observing a point. On site, those satellites obstructed by foliage and trees are either turned off or noted for removal in post-processing. If six or more un-obstructed satellites with a GDOP (measure of the geometry of the constellation) of 4 or less are available, then the measurement commenced for a minimum of 15 minutes of data collection. If the geometry and number of satellites are insufficient then the receiver is moved to the next point and returned later when satellite availability improves

Three Leica geodetic GNSS receivers and antennas listed below were utilized to collect, and store satellite signal data. Three, 2 meter fixed height poles were set at the base stations and for the observations of the monitoring points. Prior to initiating the field observations a calibration of the fixed height poles was conducted with a theodolite to verify their heights and plumb. The top of the poles were found to be plumb within 0.004 feet of the bottom consistent with prior years. Additional checks were made each day. There were no equipment failures.

GNSS Survey Parameters:

Date of Field Surveys: 09/10/12 to 09/16/12 (09/14/2012 mean date) 0600-1800 PDST (+7 hrs for UTC).

Constellation: 30 NAVSTAR GPS satellites and 23 GLONASS satellites.

Observables: L1 & L2 Carrier Waves and Codes

Epoch Rate & Occupation Times: 10 seconds for 15 minutes and 4-11 hours for CGPS connections.

Minimum Satellites: 11; GDOP < 4 ; Elevation Mask for Data Collection and Processing: 15 degrees;

Ephemeris: Rapid for Static Post-Processing for CGPS connections and Broadcast for on site.

Weather conditions: Generally clear skies and mild temperatures.

Space Weather: Boulder K Index was 1-3 on a scale of 0-9 (<5 preferred) which gauges ionospheric activity.

Equipment:

GNSS Base Receiver Unit No.: M5, Operator: M. McGee, PLS; Station Occupied: AB61 (Base1)

Make & Model: Leica GS15; Antenna Leica GS15; Mount: Fixed Height Pole #2; Antenna Height: 2.086m

GNSS Rover Receiver Unit No.: M6, Operator: M. McGee, PLS;

Make & Model: Leica GS15; Antenna Leica GS15; Mount: Fixed Height Pole #1; Antenna Height: 2.087m

GNSS Rover Receiver Unit No.: M7, Operator: M. McGee, PLS, Station Occupied: AB20 (Base2)

Make & Model: Leica GS15; Antenna Leica GS15; Mount: Fixed Height Pole #3; Antenna Height: 2.085m

Vectors were processed using Leica LGO v8.1 post processing software. Analysis of residuals led to the rejection of 3 out of 47 vectors connecting the CGPS Stations and AB61, and 6 out of 251 vectors connecting monitoring points. Network adjustments and analysis were performed with "Starnet-PRO" version 7.0 software. Rinex files of the satellite measurements for the CGPS Stations were downloaded from the SOPAC website. The Rapid Ephemeris and Absolute Antenna Models were downloaded from the NGS website. The Absolute Antenna Models published by the NGS replaced the Relative Models used prior to 2011.

NETWORK

AB61, the primary Base Station, sits on Portuguese Point and is the focal point of the static network connecting the monitoring points and CGPS Stations. 72 on site points and 3 CGPS Stations were connected with 298 vectors measured 1-3 times. See the Network Maps on the next page and the Aerial View in the Appendix.

The monitoring plan uses the CGPS Stations to verify the stability of the reference frame. During the time of this survey PVHS was not available. The primary CGPS Station used to control this survey is PVE3 located just south of City Hall and 1.8 miles west-northwest of the Base Station AB61. CGPS Station PVRS is 3.9 miles northeast, and VTIS is 4.9 miles east-southeast of AB61 as shown on the Network diagram.

MONITORING POINT HISTORY and STATUS

For data management purposes during the field survey and data processing, the point names were prefixed with "M06" to distinguish between different monitoring surveys i.e. AB61 was named M06AB61. M06 indicates this survey is the sixth monitoring since the initial September 2007 Monitoring Survey. The prefix is stripped in the final Report.

Between 1994 and 2006, 149 monitoring points were established to monitor the Portuguese Bend Landslides, many of which are lost or destroyed. Sixty of the original points were recovered in 2007. Eight of the 60 points were deleted because they were in close proximity of other points better suited for GNSS leaving 52 points monitored and reported between September 2006 and September 2007. Three of the 52 points (AB09, KC11, PB51) were monitored in September 2007 for the last time because they were replaced by new points, set nearby and better suited for satellite observations. Eighteen new points were set in 2007 and had their movements reported for the first time in the following December 2008 survey. Therefore, in December 2008, 49 original and 18 new points were surveyed for a total of 67 monitoring points.

In the September 2007 Report, it was noted that KC01 was previously reported by others on 9/14/2006 to have moved N 29°E 1.24' from its 12/9/2005 position. In the 2008 survey, a buried partially illegible brass cap in concrete stamped "COUNTY ENGINEER RE8869 1956 STA ??IELDS" was found S31°29'W 1.48 feet from the 1" IP that was used in the initial September 2007 and subsequent surveys. The original 1994 position of KC01 was re-referenced to the 1" IP, resulting in correct overall reported movements.

In the December 2008 Report, it was noted that AB05 had been disturbed by a mowing machine. AB05 was found chipped and leaning to southerly about 0.4'. The movement reporting resumed in 2009. Analysis of the movement and historic data made it possible to estimate the disturbance to within 0.05'. The original 1995 position of AB05 was re-referenced S14°02'E 0.29' to be consistent with the disturbed position, resulting in correct overall reported movements.

In 2009, PB64 was set east of the Archery Range to replace PB63 (set 2007) which had become unsafe to access and was lost in 2010.

In 2010, points AB03 and BB25 were discontinued. AB03 is on the edge of a cliff 192 feet west-southwest of AB61 making it redundant, and BB25 is on an unstable rock disturbed by wave action. In the summer of 2010, PB62 was destroyed by road construction. In October 2010, PB65 was set 24' south-southwest of PB62 and reported for the first time in October 2011. The following points may have been disturbed as of October 2010. AB05 appears to have been disturbed by mower machinery, AB15 (½" GIP in a meter box) is being driven over by vehicles occasionally accessing an adjacent field, and KC02 (½" GIP in a meter box) is occasionally parked on by vehicles accessing the beach.

In October 2011, new points AB62R and AB63R (now referred to as AB62 and AB63) were set to replace AB06 and AB07 which were hazardous to occupy due to their location near the traveled way of Palos Verde Drive South. A deep set permanent monument is planned to be constructed in the future near AB62 and AB63.

Prior to initiating the September 2012 survey, eight new monuments AB64, AB65, AB66, AB67, AB68, CR53, KC17 and PB66 were constructed to replace AB54, AB18, AB52, AB55, AB15, CR52, KC04 and PB53 respectively. The monuments were replaced because of poor sky visibility except for KC04 which was difficult to access and AB55 which was destroyed by trenching in the past year. Interim monuments were set with the following design. Monuments set in soil are 1" x 5' GIP driven flush with a 6" PVC pipe sitting on a concrete collar down about 18". Monuments set in asphalt are 1/2" x 2' rebar driven below the surface inside a free floating concrete collar. See the "Monitoring Point Status for 2013 Prepared December 09, 2012" in the Appendix.

ADJUSTMENTS & ANALYSIS

Adjustment 1: Minimally Constrained Adjustment processed to develop NAD83 (2007) 2007.00 Epoch Geodetic, Ellipsoid and State Plane Coordinates.

Fixed Control: CGPS Station PVE3 was fixed at its published NAD83 (2007) position in a Minimally Constrained Adjustment to determine positions of points in this survey and to check its stability relative to other CGPS stations. PVE3 is located 2 miles west of the slide area has been fixed in all adjustments since 2007. The CSRC publishes a Time Series for the horizontal and vertical stability of PVE3 which indicate the position has been stable over a ten year period to date. The primary base station AB61 and two other CGPS Stations were measured relative to PVE3 and used to assess stability of the reference frame. The positions are based on 9 to 11 hour measurements collected on six days. The coordinate differences at the CGPS Stations from previous positions to the present are listed below in feet.

10/2011 Positions to 09/2012					9/2007 Positions to 09/2012			
Station	dN	dE	dZ		Station	dN	dE	dZ
PVE3	0.000	0.000	0.000	< Fixed >	PVE3	0.000	0.000	0.000
PVRS	0.000	0.000	0.015		PVRS	-0.003	0.013	0.039
VTIS	-0.008	-0.006	-0.005		VTIS	-0.009	0.004	0.012
AB61	0.011	0.005	0.017	<Base Station>	AB61	-0.011	0.006	-0.015

The following is noted: (1) the two dimensional (2D) differences in the measured positions from the October 3, 2011 to the September 14, 2012 of the two CGPS Stations range 0.000 to 0.010 feet and 0.012 feet at AB61; (2) the 2D differences of the CGPS Stations since the initial 2007 survey to the present, range 0.012 to 0.013 feet and 0.012 feet at AB61; and (3) points AB17, CR50, FT08, KC07 and KC16 have a stable history when comparing their 2007 positions with this survey indicating a repeatability of less than 0.02 feet as listed in the attached "FULL DATA POSTING". The vertical components are within 0.02 feet.

Therefore, the survey reference frame is deemed stable and successfully recovered at the level of 0.01 feet horizontally by 0.02 feet vertically as indicated. An adjustment constrained to the CGPS Stations is not preferred or necessary because the purpose here is to track their relative positions over time to test the stability of the reference frame. See the attached file "COORDINATE LIST – September 14, 2012" for a list of coordinates resulting from this adjustment. See prior Reports for coordinates resulting from earlier surveys.

Adjustment 2: Minimally Constrained Adjustment to develop Orthometric Heights (Elevations) in NAVD88

Fixed Control: The CGPS Station PVE3 was fixed horizontally and vertically at its NAVD88 orthometric height determined in the September 2007 survey. The 2007 height was based on the published 2nd Order NAVD88 Height of CGPS Station VTIS. This Adjustment combined the measured ellipsoid height differences with the NGS Geoid 03 (models the separation between the ellipsoid and geoid surfaces) to determine NAVD88 orthometric heights of the other CGPS Stations and the monitoring points. The differences from the previous survey to the heights determined in the present survey are listed below in feet.

10/2011 to 09/2012		
PVE3	0.000	Fixed
PVRS	0.015	
VTIS	-0.005	

Note: This survey's measurements from PVE3 to VTIS check the 2011 height -0.005 feet, same as the ellipsoid height check above and very acceptable for GNSS considering the distance. In October 2011, the NGS First Order Benchmark S1053 located at the intersection of Rancho Palos Verdes South with Hawthorne Boulevard was found -0.016 feet from its records position validating the height of PVE3 based on VTIS and the Geoid03 Model. See the attached file "COORDINATE LIST - September 14, 2012" Survey" for a list of heights resulting from this survey.

ACCURACY

These surveys conform to the intent of the Federal Geodetic Control Subcommittee (FGCS) "Specifications for GPS Relative Positioning" (1988) and the California Geodetic Control Committee (CGCC) "Specifications for High-Production GPS Surveying Techniques" (1993). The vector residuals at each point and the closures on stable control points discussed in "Adjustment 1" are good indications of the accuracies obtained by this survey

Vector Residuals: The two dimensional vector residuals and the absolute value of the vertical residuals resulting from Adjustment #1 are listed below in feet.

	No.	Two Dimensional Residuals			Vertical Residuals (absolute values)		
		Average	Std.Dev.	Maximum	Average	Std.Dev.	Range
Monitoring Pts	245	0.008	0.006	0.035	0.010	0.008	-0.03 to +0.03
CGPS Stations	44	0.008	0.006	0.022	0.010	0.008	-0.03 to +0.02

Vector Accuracy: The lengths, precisions and relative distance errors resulting from the adjustment at the 95% Level of Confidence for the vectors (baselines) are listed below in feet.

	Lengths		PPM Precisions		Relative Dist.Error		
	Vary	Average	Vary	Average	Average	Maximum	Precision
Monitoring Pts	479-7182	3191	0.7-25	4.1 ppm	0.010	0.030	1: 319,000
CGPS Stations	9397-26102	18357	0.2-0.4	0.3 ppm	0.004	0.005	1:4,589,000

The precision ratio based on the averages for the vectors connecting the Monitoring Points exceeds the criteria for a First Order (C-1) by a factor of 3.2, and the vectors connecting AB61 and the CGPS Stations exceeds the criteria for a B Order survey by a factor of 4.6 per the FGCS requirements for the former classification system.

Coordinate Accuracy: The Standard Deviations (68% Level of Confidence) of the coordinates derived from Adjustment #1, relative to the CGPS Station PVE3 follow in feet.

	Monitoring Point			CGPS Stations		
	North	East	Up	North	East	Up
Average Standard Deviation	0.004	0.004	0.012	0.002	0.002	0.006
Maximum Standard Deviation	0.011	0.011	0.046	0.002	0.002	0.006

Absolute Coordinate Accuracy: The network accuracy is expected to be less than 0.02 feet horizontal relative to the NAD83 Datum based on the CGPS Station PVE3 fixed in Adjustment #1.

NAVD88 Heights: The North American Vertical Datum of 1988 orthometric heights resulting from Adjustment #2 are derived from the difference in ellipsoid heights combined with the Geoid 03 model and constrained to the height of PVE3 determined in 2007 based on VTIS. The measured ellipsoid heights relative to PVE3 are expected to be within 0.03 feet but may be greater at obstructed sites. The absolute accuracy of the heights relative to the datum is dependent on the published value on the CGPS Station VTIS.

Although relative elevation accuracies can be within 0.03 feet, up until October 2011 there were no requirements for vertical accuracies. In October 2011, a preference of 0.03 foot relative vertical accuracy was instigated for the following points: AB17, AB57, CR07, CR50 and CR51. In this survey campaign, the criteria has been extended to all points.

Movement Accuracy: For this period, 48 points moved less than 0.30 feet with an average of 0.06 feet. The relative error at the 95% Level of Confidence averaged 0.024 feet with a standard deviation of 0.008 feet and a range of 0.006 to 0.039 feet and one at 0.057 feet at a severely obstructed site. Overall, the relative error averaged 0.027 feet with a standard deviation of 0.009 feet and a range of 0.006 to 0.058 feet. No movement is considered detected unless the movement exceeds the 95% Error for individual points. See Page 6 of the attached "FULL DATA POSTING" for the estimated relative error at the 95% Level of Confidence for individual points.

QUALITY CONTROL - QUALITY ASSURANCE (QAQC) ANALYSIS

To ensure the accuracy and validity of the systems used to obtain the accuracies reported in these GNSS control surveys, an independent test was made using conventional terrestrial based instruments as reported in the "QAQC ANALYSIS" section of the September 2007 Monitoring Survey Report. Comparing the results of the GNSS systems with conventional instrumentation found horizontal measurements agreed 0.01 feet on average. In November of 2011 the GNSS instruments and fixed height poles used in this survey were calibrated on the Santa Maria National Geodetic Survey Baseline and found to agree with published values 0.003 to 0.006 feet.

To validate the radial survey method used in these surveys to position points from a single base station (AB61), independent GNSS cross connections were measured and compared with the computed inverse distances in the 2007, 2008 and 2009 surveys. The results found the two dimensional accuracy to agree 0.01 feet on average, indicating the radial method of measurements is reliable and the extra labor cost of measuring cross connection between points is not warranted. See the "QAQC ANALYSIS" section of the September 2007 and the December 2008 Monitoring Survey Reports for detailed analysis.

DEFLECTION ANALYSIS

Deflection Analysis is a method established by this surveyor to assess the consistency of the direction of movements reported from period to period. Assuming that movements are generally linear, the separation or the deflection between the direction of the previous and present periods taken over the moved distance, is an implied indication of the accuracy obtained with the current measurement technology and a method to detect blunders. Analysis of individual deflections in this survey campaign indicates that for points with multiple occupations the separations varied 0.01 to 0.02 feet, and for single occupied points the separations varied 0.03 to 0.04 feet.

SUMMARY

Prior to September 2007, successive coordinate differences were used to compute movements which did not provide statistical information about the relative accuracies. An upgrading of field procedures and processing techniques began with the initial September 2007 survey. Thereafter, measurement of temporal movements are based on a rigorous simultaneous least squares adjustment of multiple observations at two different epochs for each point.

The results of the October 3, 2011 to September 14, 2012 monitoring period indicates the relative accuracy of the reported movements average 0.027 feet at the 95% Level of Confidence. Statistically, the probability at the 95% level of confidence is that movement (signal) has occurred at a point when the horizontal distance between two epochs is greater than the 95% Error (noise). See the "Full Data Posting" for a listing of the 95% Error estimates (range 0.006 to 0.058 feet). Applying this criteria, 12 points have not moved.

Between October 3, 2011 to September 14, 2012 (11.4 months), points in the Portuguese Bend Landslide (PB points) moved 0.08 to 23.57 feet; points in the Abalone Cove Landslide (AB points) west of the Portuguese Bend Landslide moved 0.04 to 0.10 feet; and points in the Klondike Canyon (KC points) east of the Portuguese Bend Landslide moved 0.04 and 0.08 feet. See the Contours of Horizontal Movement in the Appendix for a graphical representation of the movements across the site.

Velocity Analysis: Overall in the present period (11.4 month), points with an indicated movement greater than 0.04 feet except for PB64 have moved on average 54% of the previous period (11.3 months). PB64 moved 108%. The City Geologist should be referred to for assessment and interpretation of the movements.

McGEE SURVEYING CONSULTING

See the attached "FULL DATA POSTING" spreadsheet for overall and periodic movements of each point. The movements are given in north, east and up or down as well as a vector of distance and direction relative to north. The direction is given as an azimuth in degrees where 0° is north and increases clockwise (180° is south). The overall movements are from the beginning position of each point which varies between 1994 and 2011.

The present listing and status of monitored points is provided in the Appendix under "Monitoring Point Status for 2013 Prepared 12/09/2012". The historical status of all monitoring points is provided in the September 2007 Survey Report. The historical 1994-2006 positions of all points are listed in the Charles Abbott Associates Inc. file "ALL POINTS MOST RECENT OBSERVED POSITION AS OF SEPTEMBER 15, 2006.xls" attached as an electronic file to the 2007 Report.

RECOMMENDATION

An ongoing re-location program for monuments has long term benefits resulting in better accuracy lower cost surveys. In this survey seven monuments were re-located for improved sky visibility for tracking satellites. A program agreed on in the 2011 Planning Meeting calls for the establishment or replacement of monitoring points with deep set monuments to better detect sub-surface movements. These monuments are expected to be as deep as 10 feet with the upper 4 feet separated from surface motion.

Attachment: Find the following document as an attached to this Report.
"FULL DATA POSTING" lists the coordinates of the initial positions and the overall and periodic movements of monitoring point since 2007 in NAD83(2007.00) State Plane Coordinates and NAVD88 Heights.

SURVEYOR'S STATEMENT

This Report on the criteria, procedures and results of the September 2012 Rancho Palos Verdes Portuguese Landslide Monitoring Survey was prepared by me January 10, 2013 and revised to include the April 2013 Partial Monitoring on March 12, 2014 at the request of Ron Dragoo, Assistant City Engineer of the City of Rancho Palos Verdes.

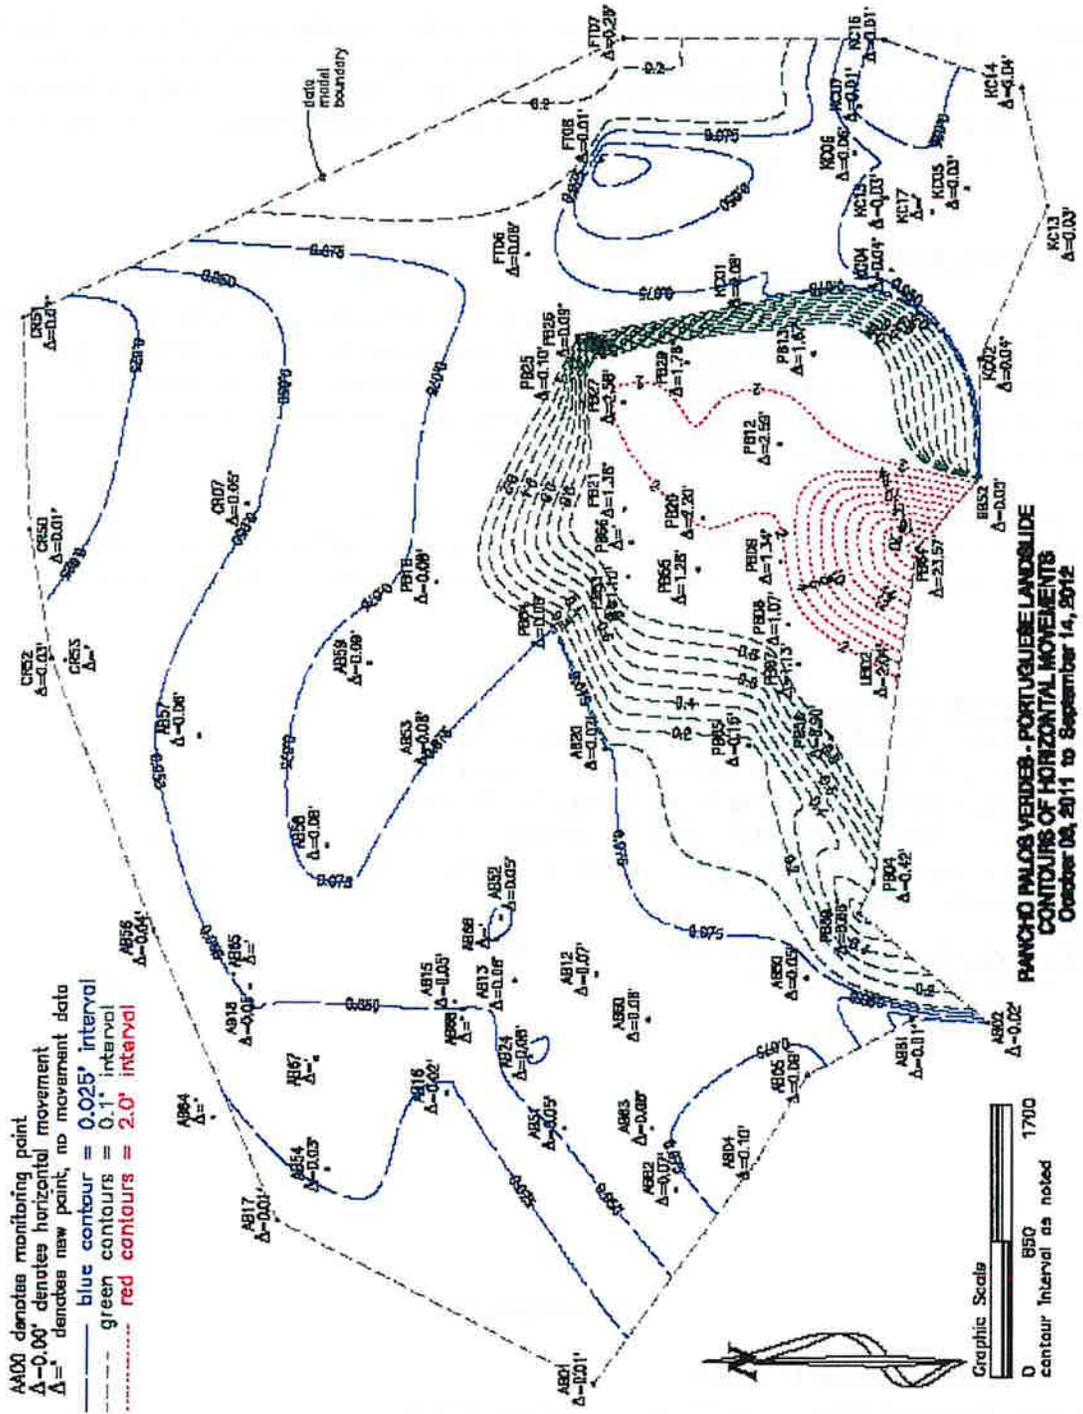

Michael R. McGee P.L.S. 3945

APPENDIX

- 12- Contours of Horizontal Movements
- 13- Aerial Photo and Oblique Aerial View of Monitoring Points
- 14- Monitoring Point Status
- 15- Coordinate List- Sept. 14, 2012 Survey NAD83(2007) Geodetic, Grid Coordinates, NAVD88
- 16 Addendum Report for the April 18, 2013 Partial Monitoring Survey

1- Contours of Horizontal Movements (north is left) Oct. 2011 to Sept. 2012 (Contours at 0.025, 0.10 and 2.00 feet provide a general graphical representation of movements; see the Full Data Posting for actual movements; see the City Geologist for interpretation of movements)

2- Aerial Photo View of Monitoring Points – (Photography Dated 03/07/2011) (north up)

2- Aerial Photo View of Monitoring Points – (Photography Dated 03/07/2011) (north up)

3- Oblique Aerial View of Monitoring Points (looking north)

Monitoring Point Status for 2013 Prepared 12/09/2012

RANCHO PALOS VERDES - PORTUGUESE LAND SLIDE MONITORING

Notes: 162+/- Monitoring Points established since 1994
 09/01/07 71 Points Surveyed 60 old points found with 52 monitored plus 19 new points
 12/01/08 67 Points Surveyed AB09, KC11, PB51 discontinued; BB53 destroyed; AB05 disturbed
 11/01/09 68 Points Surveyed Set PB64 to replace PB63 destroyed subsequently
 10/01/10 65 Points Surveyed Discontinued AB03, BB25; set PB65 to replace PB62 destroyed by paving
 10/03/11 69 Points Surveyed; Set AB62 & AB63 to replace AB06 & AB07
 09/14/12 72 Points Surveyed; Discontinued AB06, AB07; AB55 destroyed by trenching; Added 8 new points
 2013 65 Points to Survey; Discontinue AB15, AB18, AB52, AB54, CR52, KC04, PB53

Addendum Report
 for the
April 18, 2013 Partial Monitoring Survey
 of the
Portuguese Landslide
 for the
City of Rancho Palos Verdes
 by
McGee Surveying Consulting

Overview:

This Addendum Report describes a mid-year partial monitoring survey in April 2013 at Portuguese Bend. A sub-set of 27 monitoring points were included in this survey. This survey follows the procedures described in the above Report on the September 14, 2012 full monitoring. The results of the survey are reported in the attached spreadsheet titled "FULL DATA POSTING" listing the coordinates, overall and periodic movements of points listed on Page 7.

The movements reported between September 14, 2012 and April 18, 2013 (7.0 months) statistically attained an overall average accuracy of 0.014 feet at the 95% Level of Confidence as demonstrated by the measured vector residuals, repeatability of measurements at points considered stable, and the analysis of movement deflections. For a detailed history of the program and surveys see "History" above. The field survey took place April 16-19 and on April 26, 2013. The Field Surveys, Equipment, Data Collection and Network Design were as described in the above Report. The survey included 27 on site points and 3 CGPS Stations each connected with two to eight vectors for a total of 124 vectors. The Adjustments followed the process as described above with similar results.

Adjustments

Adjustment 1: Minimally Constrained Adjustment processed to develop NAD83 (2007) 2007.00 Epoch Geodetic, Ellipsoid and State Plane Coordinates in feet. **Fixed Control:** CGPS Station PVE3. Difference are in feet from the previous positions shown.

09/2012 Positions to 04/2013				
Station	dN	dE	dZ	
PVE3	0.000	0.000	0.000	< Fixed >
PVRS	-0.019	-0.006	-0.046	
VTIS	-0.006	-0.004	-0.034	
AB61	0.004	-0.002	0.044	<Base Station>

The survey reference frame was deemed stable and successfully recovered.

Summary of Movements: Between September 14, 2012 and April 18, 2013 (7.0 months) points in the Portuguese Bend Landslide (PB points) moved 0.07 to 12.63 feet; points in the Abalone Cove Landslide (AB points) west of the Portuguese Bend Landslide moved 0.01 to 0.06 feet; and points in the Klondike Canyon (KC points) east of the Portuguese Bend Landslide moved 0.01 and 0.02 feet. See the attached "FULL DATA POSTING".

MONITORING POINTS

NAD83 (2007) STATE PLANE COORDINATES & NAVD88 ELEVATIONS of Original Positions, 2007 & Post 2007 Positions

- Notes: # Indicates stable points, not moving
 * Indicates no signal of horizontal movement detected in the last period at the 95% level of confidence
 1= 2005 and prior surveys used a nearby monument S31-29W 1.48', the original position is adjusted here to be relative to the 1" IP used presently, resulting in correct Overall Movements, see Reports
 9/24/2007 (1994) Indicates the 2007 position was used for overall; see the 2011 Report for original positions in 1994

Notes:

- # Indicates stable points, not moving
- * Indicates no signal of horizontal movement detected in the last period
- 2 = Hit by mower sometime between 09/07 and 12/08 with an estimated displacement S14E 0.29', the original position is adjusted here to be relative to monitored position used presently, resulting in correct Overall Movements, see Rpt

PORTUGUESE POINT LANDSLIDE MONITORING - FULL DATA POSTING as of September 14, 2012
 Prepared by McGee Surveying Consulting - Document Date: 9/30/2013
 Monitoring Point Movements

Notes:
 * Indicates no signal of horizontal movement detected in the last period

Point	Sept. 14, 2012 Positions			Overall Movements (US Feet)						Periodic (11.4 months) Movements (US Feet)						
	NADE83 SPC Zone 5 (Feet)			Original Position to Sept. 14, 2012						Oct. 03, 2011 Position to Sept. 14, 2012

October 03, 2011
Portuguese Landslide Monitoring Survey
for the
City of Rancho Palos Verdes
by
McGee Surveying Consulting

Client: City of Rancho Palos Verdes;

Surveyed by: McGee Surveying Consulting

Project Name: Portuguese Bend Landslide Monitoring Program

Location: City of Rancho Palos Verdes, California; **County:** Los Angeles; **State:** California

PROJECT OVERVIEW:

McGee Surveying Consulting performed slide monitoring and control surveys in October 2011 at Portuguese Bend on behalf of the City of Rancho Palos Verdes. The purpose of the survey was to establish accurate positions on monitoring points to determine overall and periodic movements. The results of the survey are described in this Report and reported on spreadsheets attached hereto.

The field survey was planned, coordinated and executed by Michael McGee, PLS3945 of McGee Surveying Consulting, Santa Barbara, California. Michael McGee, PLS was responsible for the final processing of the observations, network adjustments, analysis and reports. The monitoring points cover approximately a 1½ mile square area and are measured annually or more often as necessary to determine the rate and extent of ground movement. Global Navigation Satellite System (GNSS formerly referred to as GPS) technology was used to measure positions based on the North American Datum of 1983 (NAD83) and the North American Vertical Datum of 1988 (NAVD 88) as referenced to the California CGPS (Continuous GPS) Stations in the region which are permanently mounted GNSS receivers for monitoring seismic activity. The CGPS in California are similar to the national CORS (Continuously Operated Reference Stations).

Many of the points move a few inches or less per year; therefore, the accuracy requirement is to meet a standard of one centimeter (0.033 feet) at the 95% Level of Confidence. In the active slide area where the movements approach a foot or more per year (PB and UB points in the central portion), two centimeters (0.066 feet) is sufficient. Field procedures are designed to accomplish this purpose and Quality Control-Quality Assurance (QAQC) processes discussed hereafter are incorporated to verify these accuracies are attained.

The movements reported between October 25, 2010 and October 3, 2011 (11.3 months) statistically attained an overall average accuracy of 0.03 feet at the 95% Level of Confidence. The actual accuracies of these measurements approach 0.02 feet as demonstrated by the measured vector residuals, repeatability of measurements at points considered stable, and the Deflection Analysis. Refer to the sections titled ACCURACY, DEFLECTION ANALYSIS and SUMMARY at the end of this Report for more information.

HISTORY

This survey is a continuation of a monitoring survey program initiated by the County of Los Angeles and taken over by the City of Rancho Palos Verdes circa 1994. McGee Surveying Consulting has conducted the field surveys and reporting since September 2007. See the September 2007 Survey Report for a detailed history of the previous survey process between 1994 and 2007. See the subsequent Survey Reports for the December 2008, November 2009 and October 2010 campaigns.

PROJECT DATUMS, REFERENCE SYSTEM

Horizontal Datum: North American Datum of 1983 (NAD83) established by the National Geodetic Survey (NGS); **Epoch:** 2007.00 referred to as NAD83(2007.00).; **Units:** Feet

Reference Network: The survey is referenced to the CGPS Stations (continuously operating GNSS receivers) mounted on a stable platform. For more information see NGS Data Sheets for the PID's listed below (no data sheet exists for PVE3). The positions listed below were obtained from the California Spatial Reference Center (CSRC). CSRC provides NGS sanctioned positions for the California CGPS Stations.

CGPS	Latitude (dms)	Longitude (dms)	EH (feet)	NGS PID	NAME
PVE3	33 44 35.853290	-118 24 15.269036	235.42	none	PALOS VERDES CORS
PVHS	33 46 46.020150	-118 22 19.741258	853.99	AJ1915	PENINSULA HIGH SCH
PVRS	33 46 25.891904	-118 19 14.067218	198.63	AJ1916	PALOS VERDES RES
VTIS	33 42 45.489584	-118 17 37.712290	197.52	AJ1936	MARINE EXCHANGE

Note: PVRS falls in the proximity of a Fault Line as shown below but appears unaffected to date

McGEE SURVEYING CONSULTING

Vertical Datum: North American Vertical Datum of 1988 (NAVD88) established by the NGS
Geoid Model: Geoid 03; note Geoid09 became available from the NGS in late 2009; however, Geoid03 is retained to be consistent with prior reported heights and the purpose of determining relative changes.

Reference Network: CGPS Station VTIS is also a Second Order leveled benchmark and the basis for the published heights by this survey (see NGS Data Sheets, PID's listed above)

<u>CGPS</u>	<u>NAVD 88 Ht.(feet)</u>	
PVE3	none	
PVHS	972.1	Based on a Refined Geoid Model
PVRS	316.3	Based on a Refined Geoid Model
VTIS	315.26	Based on Second Order Leveling by CSRC and original basis for this survey

Projection: NAD83 California State Plane Coordinates Zone 5: The State Plane Coordinate Parameters follow. The average Scale Factor is 1.00007543, the Ellipsoid Height Reduction Factor based on the average ellipsoid heights is 0.99999092, and the average Combined Grid Factor is 1.00006635. Distances in this survey are grid. To obtain ground distances divide grid distances by the Combined Grid Factor. Grid bearings resulting from this survey must be rotated by a Convergence Angle to obtain geodetic (true) bearings. The average convergence angle is -0-12-30± (rotate left 0-12-30).

Datum Stability: The NAD83, 2007.00 Epoch adjustment is one of a series of adjustments of NAD83 since its adoption in 1986 and is the datum used for the monitoring surveys since 2007. Rancho Palos Verdes sits on the Pacific Plate which is moving west-northwesterly relative to the North American Plate about 4 centimeters (0.14 feet) per year. The area southwesterly of the Fault Line shown on the above map includes the City and is moving at a constant rate as exhibited by the N, E, Up velocities of the CGPS Stations listed below. These CGPS Stations provide a rigid reference frame for the Portuguese Landslide Monitoring Program that is validated during each monitoring campaign. See the Adjustment results on Page 8 and the September 2007 Monitoring Survey Report by McGee Surveying Consulting for additional information.

VTIS	0.065	-0.129	-0.002

FIELD SURVEYS, DATA COLLECTION, EQUIPMENT & PROCESSING

Sixty-nine monitoring points were occupied and reported in this October 2011 survey. Site photographs and recovery sheets detailing the location, character of the monuments and obstructions were updated. See the Appendix for "Monitoring Point Status as of October 2011"

Monument AB61 was established in September 2007 on Portuguese Point and is used as the primary base station for Monitoring Surveys. The location is secured behind a locked gate, has a mostly clear horizon above 10 degrees, and sits on a stable basalt geological formation. A 5/8" x 2' rebar with a plastic cap and tack named "AB61ECC" was set for a reference monument on 10/23/2010 to test local stability of AB61.

The field survey commenced each day by setting a GNSS receiver on a fixed height pole on AB61 while two GNSS receivers roamed freely collecting observations on fixed height poles at 68 on-site points. Many of the points are over-shadowed by mature trees and shrubberies which interfere with signals received from satellites and can affect the quality of measurements. To obtain the best possible accuracies, the satellite constellation is compared with obstruction diagrams to estimate the best time for observing a point. On site, those satellites obstructed by foliage and trees are either turned off or noted for removal in post-processing. If 5 or more unobstructed satellites with a GDOP (measure of the geometry of the constellation) of 4 or less are available, then the measurement commenced for a minimum of 10 minutes of data collection. If the geometry and number of

McGEE SURVEYING CONSULTING

satellites are insufficient then the receiver is moved to the next point and returned later when satellite availability improves. This process is followed until all points are occupied twice under a different constellation of satellites on a different day. If the two measurements are within 0.03 feet in slow movement areas or 0.06 feet in active slide areas, then they are accepted, otherwise a third measurement is obtained.

Three Leica geodetic GNSS receivers and antennas listed below were utilized to collect, and store satellite signal data. Three, 2 meter fixed height poles were used at the base station and for the observations of the monitoring points. Prior to initiating the field observations a calibration of the fixed height poles was conducted with a theodolite to verify their height and plumb. The top of the poles were found to be plumb within 0.002 feet of the bottom consistent with prior years. Additional checks were made each day. There were no equipment failures.

GNSS Survey Parameters:

Date of Field Surveys: 10/01/11 to 10/06/11 (10/03/2011 mean date) 0600-1800 PDST (+7 hrs for UTC).

Constellation: 30 NAVSTAR GPS satellites and 23 GLONASS satellites.

Observables: L1 & L2 Carrier Waves and Codes

Epoch Rate & Occupation Times: 10 seconds for 10-15 minutes and 4-11 hours for CGPS connections.

Minimum Satellites: 11; GDOP < 4 ; Elevation Mask for Data Collection and Processing: 15 degrees;

Ephemeris: Rapid for Static Post-Processing for CGPS connections and Broadcast for on site.

Weather conditions: Generally clear skies and mild temperatures.

Space Weather: Boulder K Index was 1-3 on a scale of 0-9 (<5 preferred) which gauges ionospheric activity.

Equipment:

GNSS Base Receiver Unit No.: M5, Operator: M. McGee, PLS; Station Identification: AB61 (Base)

Make & Model: Leica GS15; Antenna Leica GS15; Mount: Fixed Height Pole #2; Antenna Height: 2.086m

GNSS Rover Receiver Unit No.: M6, Operator: M. McGee, PLS;

Make & Model: Leica GS15; Antenna Leica GS15; Mount: Fixed Height Pole #1; Antenna Height: 2.087m

GNSS Rover Receiver Unit No.: M7, Operator: R. Reese, PLS,

Make & Model: Leica GS15; Antenna Leica GS15; Mount: Fixed Height Pole #3; Antenna Height: 2.085m

Vectors were processed using Leica LGO v8.1 post processing software. Analysis of residuals led to the rejection of 7 out of 37 vectors connecting the CGPS Stations and AB61, and 3 out of 129 vectors connecting monitoring points. Network adjustments and analysis were performed with "Starnet-PRO" version 6.0 software. Rinex files of the satellite measurements for the CGPS Stations were downloaded from the SOPAC website. The Rapid Ephemeris and Absolute Antenna Models were downloaded from the NGS website. The Absolute Antenna Models recently published by the NGS replaced the Relative Models used in previous years and were used for the first time in the processing of vectors.

NETWORK

AB61, the primary Base Station, sits on Portuguese Point and is the focal point of the static network connecting the monitoring points and CGPS Stations. Sixty-nine on site points and 4 CGPS Stations were connected with 77 vectors measured 1-3 times. See the Network Maps on the next page and the Aerial View in the Appendix.

The monitoring plan uses the four CGPS Stations to verify the stability of the reference frame. The primary station is CGPS Station PVE3 located near City Hall 1.8 miles west-northwest of the on-site Base Station AB61. CGPS Station PVHS is 2.8 miles north, PVRS is 3.9 miles northeast, and VTIS is 4.9 miles east-southeast of AB61 as shown on the Network diagram.

MONITORING POINT STATUS

For data management purposes during the field survey and data processing, the point names were prefixed with "M05" to distinguish between different monitoring surveys i.e. AB61 was named M05AB61. M05 indicates this survey is the fifth monitoring since the initial September 2007 Monitoring Survey. The prefix is stripped in the final Report. In the initial 2007 survey, the field and office procedures were modified to increase the accuracy and reliability of measurements and provide for queries between epochs that include statistical information about the precisions of the reported movements.

Between 1994 and 2006, 149 monitoring points were established to monitor Portuguese Bend Slides, many of which are lost or destroyed. Sixty of the original points were recovered in 2007. Eight of the 60 points were deleted because they were in close proximity of other points better suited for GNSS leaving 52 points monitored and reported between September 2006 and September 2007. Three of the 52 points (AB09, KC11, PB51) were monitored in September 2007 for the last time because they were replaced by new points, set nearby and better suited for satellite observations. Eighteen new points set in 2007 had their movements reported for the first time in the December 2008 survey. In December 2008, 49 original and 18 new points were surveyed for a total of 67 monitoring points.

In the September 2007 Report, it was noted that KC01 was previously reported by others on 9/14/2006 to have moved N 29°E 1.24' from its 12/9/2005 position. In the 2008 survey, a buried partially illegible brass cap in concrete stamped "COUNTY ENGINEER RE8869 1956 STA ??IELDS" was found S31°29'W 1.48 feet from the 1" IP that was found and used in the initial September 2007 and subsequent surveys. The original 1994 position of KC01 was adjusted to be consistent with the 1" IP, resulting in correct overall reported movements.

In the December 2008 Report, it was noted that AB05 had been disturbed by a mowing machine. AB05 was found chipped and leaning to southerly about 0.4'. The movement reporting resumed in 2009. Analysis of the movement and historic data made it possible to estimate the disturbance to within 0.05'. The original 1995 position of AB05 was adjusted S14°02'E 0.29' to be consistent with the disturbed position, resulting in correct overall reported movements.

In 2009, a new point PB64 was set on the east of the Archery Range to replace PB63 (set 2007) which had become unsafe to access was lost sometime in 2010. PB64 was reported for the first time in October 2010.

In 2010, points AB03 and BB25 were discontinued for the following reasons. AB03 is 192 feet west-southwest of AB61 on the edge of a cliff, and BB25 is on an unstable rock affected by the surf. In the summer of 2010, PB62 was destroyed by road construction. In October 2010, PB65 was set 24' south-southwest of PB62. Movement of PB65 is reported for the first time in October 2011. The following points may have been disturbed as of October 2010. AB05 appears to have been disturbed by mower machinery, AB15 (½" GIP in a meter box) is being driven over by vehicles occasionally accessing an adjacent field, and KC02 (½" GIP in a meter box) is occasionally parked on by vehicles occasionally accessing an adjacent field. Raising the boxes at AB15 and KC02 will eliminate this problem.

In October 2011, new temporary reference points named AB62R to replace AB06 and AB63R to replace AB07 were set. AB06 and AB07 will be discontinued due to their location within the traveled way of Palos Verde Drive South. A deep set permanent monument will be constructed in 2012 near AB62R and AB63R and the positions will be transferred.

The present list and status of monitored points is provided in the Appendix under "Monitoring Point Status as of October 2011".

ADJUSTMENTS & ANALYSIS

Adjustment 1: Minimally Constrained Adjustment processed to develop Geodetic, Ellipsoid and State Plane Coordinates in NAD83 (2007.00)

Fixed Control: CGPS Station PVE3 was fixed at its published position in a Minimally Constrained Adjustment to determine latitude, longitude, ellipsoid heights, state plane coordinates, and to check the stability of other points. PVE3 located 2 miles west of the slide area has been fixed in all adjustments since 2007. The CSRC publishes a Time Series for the horizontal and vertical stability of PVE3 which indicate the position has been stable over a ten year period to date. The primary base station AB61 and three other CGPS Station's are measured relative to PVE3 and used to assess stability of the reference frame. The positions are based on 4 to 11 hour measurements collected on six days. The coordinate differences at the CGPS Stations from previous positions to the present are listed below in feet.

10/2010 Positions to 10/2011					9/2007 Positions to 10/2011			
Station	dN	dE	dZ		Station	dN	dE	dZ
PVE3	0.000	0.000	0.000	Fixed 2010	PVE3	0.000	0.000	0.000
PVHS	0.004	0.004	0.001		PVHS	-0.001	0.010	0.012
PVRS	0.004	0.004	0.017		PVRS	-0.003	0.013	0.024
VTIS	0.004	0.006	0.019		VTIS	-0.001	0.010	0.018
AB61	-0.002	-0.010	-0.037	Base Station	AB61	-0.022	0.001	-0.032

In regard to the stability of the reference frame, the following is noted: (1) the two dimensional (2D) differences from the October 25, 2010 to the October 3, 2011 measured positions of the three free CGPS Stations range 0.006 to 0.007 feet and 0.010 feet at AB61, (2) the 2D differences of the CGPS Stations since the initial 2007 survey to the present, range 0.010 to 0.013 feet and 0.022 feet at AB61, (3) the CGPS, points AB54, AB61, CR50, KC07 and KC16 have a stable history and comparing their previous positions with this survey indicates repeatable stability at less than 0.02 feet as listed in the attached "FULL DATA POSTING".

The survey reference frame is deemed stable and successfully recovered at the level indicated. An adjustment constrained to the CGPS Stations is not necessary because the purpose here is to track their relative positions over time to test the stability of the reference frame. See the attached file "COORDINATE LIST-October 3, 2011" for a list of coordinates resulting from this adjustment. See prior Reports for coordinates resulting from earlier surveys.

Adjustment 2: Minimally Constrained Adjustment processed to develop Orthometric Heights (Elevations) in NAVD88

Fixed Control: The CGPS Station PVE3 was fixed horizontally and vertically at its NAVD88 orthometric height determined in the September 2007 survey. The 2007 height was based on the published 2nd Order NAVD88 Height of CGPS Station VTIS. This Adjustment combined the measured ellipsoid height differences with the NGS Geoid 03 (models the separation between the ellipsoid and geoid surfaces) to determine NAVD88 orthometric heights of other CGPS Stations and the monitoring points. The differences from prior surveys to the heights determined in the present survey are listed below in feet.

10/2010 to 10/2011				9/2007 to 10/2010	
PVE3	0.000	Fixed	PVE3	0.000	
PVHS	0.001		PVHS	0.009	
PVRS	0.017		PVRS	0.028	
VTIS	0.018		VTIS	0.016	

Note: This survey's measurements from PVE3 to VTIS check the 2010 height +0.018 feet and the 2007 survey +0.016 feet both very acceptable for GNSS considering the distance. The NGS Benchmark S1053 located at the intersection of Rancho Palos Verdes South with Hawthorne Blvd. was measured on another survey and found -0.016 feet from its records position validating the height of VTIS and the use of the Geoid03 Model. See the attached file "COORDINATE LIST-Oct 2011 Survey" for a list of heights resulting from this survey.

ACCURACY

These surveys conform to the intent of the Federal Geodetic Control Subcommittee (FGCS) "Specifications for GPS Relative Positioning" (1988) and the California Geodetic Control Committee (CGCC) "Specifications for High-Production GPS Surveying Techniques" (1993). The vector residuals at each point and the closures on stable control points discussed in "Adjustment 1" are good indications of the accuracies obtained by this survey

Vector Residuals: The two dimensional vector residuals and the absolute value of the vertical residuals resulting from Adjustment #1 are listed below in feet.

	Two Dimensional Residuals			Vertical Residuals (absolute values)		
	Average	Std.Dev.	Maximum	Average	Std.Dev.	Range
Monitoring Pts	0.009	0.007	0.036	0.011	0.011	-0.04 to +0.04
CGPS Stations	0.006	0.004	0.018	0.013	0.011	-0.03 to +0.04

Vector Accuracy: The lengths, precisions and relative distance errors resulting from the adjustment at the 95% Level of Confidence for the vectors (baselines) are listed below in feet.

	Lengths		PPM Precisions		Relative Dist.Error		
	Vary	Average	Vary	Average	Average	Maximum	Precision
Monitoring Pts	192-7134	3468	2.2-108	9.0 ppm	0.019	0.034	1: 183,000
CGPS Stations	9396-26103	18842	0.2-0.4	0.3 ppm	0.005	0.006	1:3,768,000

The precision ratio based on the averages for the vectors connecting the Monitoring Points exceeds the criteria for a First Order (C-1) by a factor of 1.8, and the vectors connecting AB61 and the CGPS Stations exceeds the criteria for a B Order survey by a factor of 3.8 per the FGCS requirements for the former classification system.

Coordinate Accuracy: The Standard Deviations (68% Level of Confidence) of the coordinates derived from Adjustment #1, relative to the CGPS Station PVE3 follow in feet.

	Monitoring Point			CGPS Stations		
	North	East	Up	North	East	Up
Average Standard Deviation	0.008	0.007	0.027	0.002	0.002	0.004
Maximum Standard Deviation	0.016	0.015	0.050	0.003	0.003	0.006

Absolute Coordinate Accuracy: The network accuracy is expected to be less than 0.02 feet horizontal relative to the NAD83 Datum based on the CGPS Station PVE3 fixed in Adjustment #1.

NAVD88 Heights: The North American Vertical Datum of 1988 orthometric heights resulting from Adjustment #2 are derived from the difference in ellipsoid heights combined with the Geoid 03 model and constrained to the height of PVE3 determined in 2007 based on VTIS. The measured ellipsoid heights relative to PVE3 are expected to be within 0.03 feet but may be greater at obstructed sites. The absolute accuracy of the heights relative to the datum is dependent on the published value on the CGPS Station VTIS.

Although relative elevation accuracies can be within 0.03 feet, up until October 2011 there were no requirements for vertical accuracies. In October 2011, a preference of 0.03 foot relative vertical accuracy was instigated for the following points: AB17, AB57, CR07, CR50 and CR51.

Movement Accuracy: For the movements reported in this period, the statistical analysis of points moving 0.30 feet or less returned an average relative error at the 95% Level of Confidence of 0.029 feet with a standard deviation of 0.006 feet and a range of 0.008 to 0.047 feet. Overall, the relative error averaged 0.031 feet with a standard deviation of 0.009 feet and a range of 0.008 to 0.062 feet. No movement is considered detected unless the movement exceeds the 95% Error for individual points. See Page 5 of the attached "FULL DATA POSTING" for the estimated relative error at the 95% Level of Confidence for individual points.

QUALITY CONTROL - QUALITY ASSURANCE (QAQC) ANALYSIS

To ensure the accuracy and validity of the systems used to obtain the accuracies reported in these GNSS surveys, an independent test was made using conventional terrestrial based instruments as reported in the "QAQC ANALYSIS" section of the September 2007 Monitoring Survey Report. Comparing the results of the GNSS systems with conventional instrumentation found horizontal measurements agreed 0.01 feet on average. In November of 2011 the GNSS instruments used in this survey were calibrated on the Santa Maria National Geodetic Survey Baseline and found to agree with published values 0.003 to 0.006 feet.

To validate the radial survey method used in these surveys to position points from a single base station (AB61), independent GNSS cross connections were measured and compared with the computed inverse distances in the 2007, 2008 and 2009 surveys. The results found the two dimensional accuracy to agree 0.01 feet on average, indicating the radial method of measurements is reliable and the extra labor cost of measuring cross connection between points is not warranted. See the "QAQC ANALYSIS" section of the September 2007 and the December 2008 Monitoring Survey Reports for detailed analysis.

DEFLECTION ANALYSIS

Deflection Analysis is a method established by this surveyor to assess the consistency of the direction of movements reported year over year. Not including points in the Portuguese Bend Landslide (UB and PB points) with movements larger than 0.7 feet, analysis of deflections indicate that: AB05 and AB15 were disturbed in the previous period as noted in the 2010 Report and have resumed their previous direction of movement.

It is noted that AB12, AB51, AB58 and CR07 exhibited inconsistent movement directions in previous periods which may be normal activity for these sites. This survey reports this as a matter of information and defers to the opinion of the City Geologist for the meaning of these findings.

Excluding the above points, for the remaining 37 points the movements averaged 0.09 feet with a maximum of 0.30 feet and the average separation was 0.02 feet with a standard deviation of 0.01 feet indicating for the most part small movements are linear. Additionally, assuming that movements are linear over small distances, the separation or the deflection between the direction of the previous and present periods taken over the moved distance, is an implied indication of the accuracy of the measurements.

SUMMARY

A modernization of field procedures and processing techniques began with the initial September 2007 survey. Thereafter, temporal movements are based on a rigorous simultaneous least squares adjustment of multiple observations at two different epochs on each point. The statistical results of the October 2010 to October 2011 monitoring period shows the relative accuracy of the reported movements averaged 0.032 feet at the 95% Level of Confidence. Prior to September 2007, successive coordinate differences were used to compute movements which did not provide statistical information about the relative accuracies.

Results of the adjustment indicate the probability at the 95% level of confidence that movement (signal) has occurred at a point when the horizontal distance between two epochs is greater than the 95% Error (noise). See the "Full Data Posting" for a listing of the 95% Error estimates (ranges 0.008 to 0.062 feet). Using these criteria, 9 points have not moved and 56 points have moved. Between October 25, 2010 and October 3, 2011 (11.3 months), points in the Portuguese Bend Landslide (PB points) moved between 0.22 and 21.83 feet. Points in the Abalone Cove Landslide (AB points) west of the Portuguese Bend Landslide moved between 0.04 and 0.30 feet. Points in the Klondike Canyon (KC points) east of the Portuguese Bend Landslide moved between 0.04 and 0.16 feet. See the Contours of Horizontal Movement in the Appendix for a graphical representation of the movements across the site.

McGEE SURVEYING CONSULTING

Velocity Analysis: Points moving 0.06 to 0.30 feet in the present period (11.3 month) are on average 2.5 times the movements for the previous period (11.1 months) and range 1.5 to 6 times. Points moving 0.74 to 21.83 feet (mostly PB points) in the present period are on average 1.1 times the movements for the previous period and range 0.7 to 2.7 times. This is about double the velocity for the former and half for the latter as reported in the October 2010 Report. The City Geologist should be referred to for assessment and interpretation of the movements.

See the attached "FULL DATA POSTING" spreadsheet for overall and periodic movements of each point. The movements are given in north, east and up or down as well as a vector of distance and direction relative to north. The direction is given as an azimuth in degrees where 0° is north and increases clockwise (180° is south). The overall movements are from the beginning position of each point which varies between 1994 and 2010.

The present listing and status of monitored points is provided in the Appendix under "Monitoring Point Status as of October 2011". The historical status of all monitoring points is provided in the September 2007 Survey Report. The historical 1994-2006 positions of all points are listed in the Charles Abbott Associates Inc. file "ALL POINTS MOST RECENT OBSERVED POSITION AS OF SEPTEMBER 15, 2006.xls" attached as an electronic file to the 2007 Report.

RECOMMENDATION

A program was agreed on in the 2011 Planning Meeting for the establishment or replacement of monitoring points with deep set monuments to better detect sub-surface movements. An ongoing re-location program for monuments will have long term benefits resulting in lower survey costs and a better understanding of sub-surface movements. It is proposed that monuments as deep as 10 feet be constructed with the upper 4 feet separated from surface movement. Presently, monuments are believed to be within 2-4 feet of the surface. At the recommendation and direction of Robert Douglas, Geologist, 4 monuments will be constructed in the spring of 2012. A \$6500 budget has been set aside for this work. As discussed on Page 7, a temporary monument was set during the present survey about 160' south-southwest of AB06 and 90' northwest of AB07. Deep set monuments will be constructed nearby to replace the temporary monuments. Additionally, a new monument is to be set about 440' south-southeast of AB07 and a replacement monument 800' north-northeast of AB54.

PORTUGUESE POINT LANDSLIDE MONITORING - FULL DATA POSTING as of Dec.2008
 Prepared by McGee Surveying Consulting - Document Date: 12/02/11

Notes:

! Indicates stable points, not moving

* Indicates no movement detected

2 = Hit by mower sometime between 09/07 and 12/08 with an estimated displacement S14E 0.29', the original position is adjusted here to be relative to monitored position used presently, resulting in correct Overall Movements, see Rpt

PORTUGUESE POINT LANDSLIDE MONITORING - FULL DATA POSTING as of Nov. 2009
 Prepared by McGee Surveying Consulting - Document Date: 12/02/11

Notes:

- # Indicates stable points, not moving
- * Indicates no movement detected

Point	Nov. 18, 2009 Positions			Overall Movements (US Feet)						Periodic (11.3 months) Movements (US Feet)						
	NAD83 SPC Zone 5 (Ft)			Original Position to Nov. 18, 2009						Dec. 10, 2008 Position to Nov. 18, 2009

Portuguese Landslide Monitoring Survey - COORDINATE LIST
 Prepared by McGee Surveying Consulting for the October 03, 2011 Survey
 Document Date: 01/12/2012

Datum: Horizontal & EH NAD83 (2007) Epoch; California State Plane Zone 5; Vertical: NAVD88

Note: Fixed CGPS Station PVE3 at Record 3D Position & Orthometric Height per 09/2007 Survey; See Survey Reports

Point	Latitude	Longitude	EH (ft)	North (ft)	East (ft)	OrthoHt (ft)	Description

Survey Report
of the
Portuguese Landslide November ~~October~~ 2010 Monitoring Survey
for the
City of Rancho Palos Verdes
by
McGee Surveying Consulting

Surveyed by: McGee Surveying Consulting of Santa Barbara, CA, and Charles Abbott Associates, Inc.
Client: City of Rancho Palos Verdes; **Project Name:** Portuguese Bend Landslide Monitoring Program
Location: Rancho Palos Verdes, California; **County:** Los Angeles; **State:** California

PROJECT OVERVIEW:

McGee Surveying Consulting performed a slide monitoring and control survey in October 2010 at Portuguese Bend on behalf of the City of Rancho Palos Verdes. The purpose of the survey was to establish accurate positions on monitoring points to determine overall and periodic movements. The results of this Survey are described in this Report and reported on spreadsheets attached hereto.

The field survey was planned, coordinated and executed by Michael McGee, PLS3945 of McGee Surveying Consulting of Santa Barbara, California in coordination with Frederick (Rick) Jones, P.E., P.L.S., City Engineer, City of Rancho Palos Verdes. Michael McGee PLS was responsible for the final processing of the observations, network adjustments, analysis and reports. The monitoring points cover approximately a 1½ mile square area and are measured annually or more often as necessary to determine the rate and extent of ground movement. Global Positioning System (GPS) technology is used for the purpose of determining positions based on the North American Datum of 1983 (NAD83) and the North American Vertical Datum of 1988 (NAVD.88) as referenced to the California CGPS (Continuous GPS) Stations in the region which are permanently mounted GPS receivers for monitoring seismic activity. The CGPS in California are similar to the national CORS (Continuously Operated Reference Stations).

Given that many points move about an inch (0.08') or less per year, the requirement is to meet a relative accuracy standard of one centimeter (0.033 feet) at the 95% Level of Confidence. In the active slide area (central portion) where the movements are greater, two centimeters (0.066 feet) is sufficient. Field procedures are designed to accomplish this purpose and Quality Control-Quality Assurance (QA/QC) processes discussed hereafter are incorporated to verify this accuracy is attained.

The movements reported between November 2009 and October 2010 (11.25 months) statistically attained an average accuracy of 0.027 feet at the 95% Level of Confidence overall as reported in the attached document "FULL DATA POSTING". The actual accuracies of these measurements are better by a factor of two as demonstrated by the measured vector residuals, repeatability of measurements at points considered stable, and the general consistency in the direction of the movements reported from one period to the next. Refer to the sections titled ACCURACY and SUMMARY at the end of this Report for more information.

HISTORY

This survey is a continuation of a monitoring survey program initiated by the County of Los Angeles and taken over by the City of Rancho Palos Verdes circa 1994. McGee Surveying Consulting has conducted the field surveys and reporting since September 2007. See the September 2007 Survey Report for a detailed history of the previous survey process between 1994 and 2007. See the subsequent Survey Reports for the December 2008 and November 2009 campaigns.

PROJECT DATUMS, REFERENCE SYSTEM

Horizontal Datum: North American Datum of 1983 (NAD83) per the National Geodetic Survey (NGS);
Epoch: 2007.00 referred to as NAD83(2007.00).; **Units:** Feet

Reference Network: The survey is referenced to the CGPS Stations which are continuously operating reference GPS receivers mounted on a stable platform (for more information see NGS Data Sheets for the PID's listed below). No data sheet exists for PVE3. The positions were obtained from the California Spatial Reference Center (CSRC). CSRC provides NGS sanctioned positions on the California CGPS Stations.

CGPS	Latitude (dms)	Longitude (dms)	EH (feet)	NGS PID	NAME
PVE3	33 44 35.853290	-118 24 15.269036	235.42	none	PALOS VERDES CORS

Note: PVRS falls in the proximity of a Fault Line as shown below but appears unaffected to date

CGPS Stations (north is up)

McGEE SURVEYING CONSULTING

Vertical Datum: North American Vertical Datum of 1988 (NAVD88) orthometric heights per NGS
Geoid Model: Geoid 03; Note, Geoid09 became available from the NGS in late 2009; however, Geoid03 is retained to be consistent with prior reported heights and the purpose of determining relative changes.

Reference Network: CGPS Station VTIS is the basis for this survey (see NGS Data Sheets)

CGPS	NAVD 88 Ht (feet)	
FVE3	none	
FVHS	972.1	Based on a Refined Geoid Model
FVRS	316.3	Based on a Refined Geoid Model
VTIS	315.26	Based on Second Order Leveling by CSRC and original basis for this survey

Projection: NAD83 California State Plane Coordinates Zone 5: The State Plane Coordinates Parameters for Zone Five follow. The average Scale Factor is 1.00007543, the Ellipsoid Height Reduction Factor based on the average ellipsoid heights is 0.99999092, and the average Combined Grid Factor is 1.00006635. Distances in this survey are grid. To obtain ground distance divide the grid distances by the Combined Grid Factor. Grid bearings resulting from this survey must be rotated by a Convergence Angle to obtain geodetic (true) bearings. The average convergence angle is -0-12-30.2± (rotate left 0-12-30).

Datum Stability: The NAD83, 2007.00 Epoch adjustment is one of a series of adjustments of NAD83 since its adoption in 1986 and is the datum used for the monitoring surveys since 2007. Rancho Palos Verdes sits on the Pacific Plate which is moving west-northwesterly relative to the North American Plate about 4 centimeters (0.14 feet) per year. The area southwesterly of the Fault Line shown on the above map includes the City and is moving at a constant rate as exhibited by the N, E, Up velocities of the CGPS Stations listed below. These CGPS Stations provide a rigid reference frame for the Portuguese Landslide Monitoring Program that is validated during each monitoring campaign. See the Adjustment results on Page 6 and the September 2007 Monitoring Survey Report by McGee Surveying Consulting for additional information.

Annual Velocities in Feet
Reference Epoch 2010.84

CGPS	North	East	Up
FVE3	0.064	-0.130	-0.002
FVHS	0.063	-0.129	-0.002
FVRS	0.062	-0.129	0.000
VTIS	0.065	-0.129	-0.002

FIELD SURVEYS, DATA COLLECTION, EQUIPMENT & PROCESSING

Sixty-five monitoring points were occupied and reported in October 2010. Site photographs and recovery sheets detailing the location, character of the monument and obstructions were updated. See the Appendix for "Monitoring Point Status as of October 2010" and "Monitoring Points Photo Update October 2010" for additional information. See prior Monitoring Survey Reports for all photos.

AB61 was established in September 2007 on Portuguese Point and is used as the primary base station because of its suitability for GPS observations. The location is secured behind a locked gate, has a clear horizon above 10 degrees, and sits on a stable basalt geological formation. A 5/8" x 2" rebar with a plastic cap and tack was set on 10/23/2010 for a reference monument named "AB61ECC" at 313-40 Azimuth, 21.155° at +0.641'.

The field survey commenced each day by setting a GPS receiver on a fixed height pole on AB61 while two GPS receivers roamed freely collecting observations on fixed height poles at the 64 on-site points. Many of the points are over-shadowed by mature trees and shrubbery which interfere with signals received from satellites and affect the quality of measurements. To obtain the highest possible accuracies, satellites are compared with obstruction diagrams to estimate the best time for observing a point. After arriving at a point to be observed, the GPS receiver is set up, and the location in the sky of each satellite is estimated with a compass and abney. Those satellites obstructed by foliage and trees are turned off. If 5 or more un-obstructed satellites with a

McGEE SURVEYING CONSULTING

GDOP (measure of the geometry of the constellation) of 4.5 or less are available, then the measurement commenced for 10-25 minutes of data collection. If sufficient satellites and geometry are not available, then the receiver is moved to the next point and returned later when satellite availability improves. This process is followed until all points are occupied twice under a different constellation of satellites on a different day. If the two measurements are within 0.03 feet in slow movement areas or 0.06 feet in active slide areas, then they are accepted, otherwise a third measurement is obtained.

Three Leica geodetic GPS receivers and antennas listed below were utilized to collect, process and store satellite signal data. Three, 2.00 meter fixed height poles were used for the base station and for the observations of the monitoring points. Prior to initiating the field observations a calibration of the fixed height poles was conducted with a theodolite to verify their height and plumb. The top of the poles were found to be plumb within 0.003 feet of the bottom consistent with prior years. Additional checks were made each day. There were no equipment failures.

GPS Survey Parameters:

Date of Field Surveys: 10/23/10 to 10/28/10 (10/25/2010 mean date) 0600-1800 PST (+8 hrs for UTC).

Constellation: The NAVSTAR GPS constellation consisted of 31 Block II satellites.

GPS Observables: L1 & L2 Carrier Wave, C/A Code & P-Code; P-code was encrypted and SA off.

Epoch Rate & Occupation Times: 10 seconds for 10-25 minutes and 6-11 hours for CGPS connections.

Minimum Satellites: 5 ; GDOP < 4.5 ; Elevation Mask for Data Collection: 10 degrees;

Processing: 10 degrees except for connections to CGPS stations at 12 degrees.

Ephemeris: Precise for Static Post-Processing for all CGPS connections and Broadcast for on site.

Weather conditions: Generally clear skies and mild temperatures.

Space Weather: Boulder K Index was 4-2 on a scale of 0-9 and gauges ionospheric activity.

GPS Base Receiver Unit No.: M5, Operator: M. McGee, PLS; Station Identification: AB61

Make & Model: Leica GS15; Antenna Leica GS15; Mount: Fixed Height Pole #1; Antenna Height: 2.086m

GPS Rover Receiver Unit No.: M6, Operator: M. McGee, PLS;

Make & Model: Leica GS15; Antenna Leica GS15; Mount: Fixed Height Pole #2; Antenna Height: 2.086m

GPS Rover Receiver Unit No.: M3, Operator: R. Reese, PLS,

Make & Model: Leica 530; Antenna Leica AT502; Mount: Fixed Height Pole #3; Antenna Height: 2.083m

Data was processed using Leica LGO post processing software. The longer baseline connections to the CGPS were processed with a precise ephemeris at a cutoff vertical angle of 12° and the shorter monitoring network baselines were processed with a broadcast ephemeris at a cutoff vertical angle of 10°. Analysis of processing statistics and residuals led to the rejection of 3 vectors. Network adjustments and analysis were performed with "Starnet-PRO" version 6.0 software. Data files in the rinex format of the satellite measurements for the CGPS Stations were downloaded from the SOPAC website. The precise ephemeris and antenna models were downloaded from the NGS website. NGS Relative Antenna models were used to process connecting vectors to CGPS Stations.

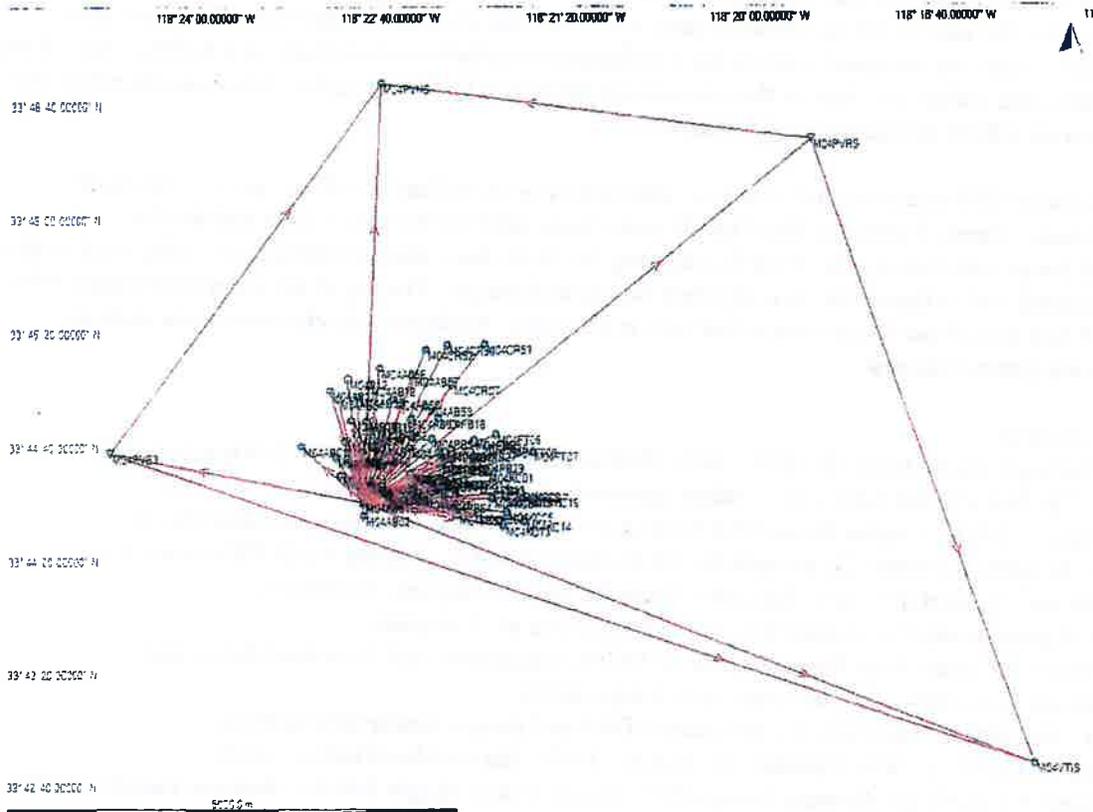

NETWORK

The monitoring plan uses four CGPS Stations and several local points to verify the stability of the reference system. The CGPS Station PVE3, near City Hall, is located 1.8 miles west-northwest of the base station point AB61. PVHS is 2.8 miles north, PVR3 3.9 miles northeast, and VTIS is 4.9 miles east-southeast of AB61 as shown on the Network diagram on the next page.

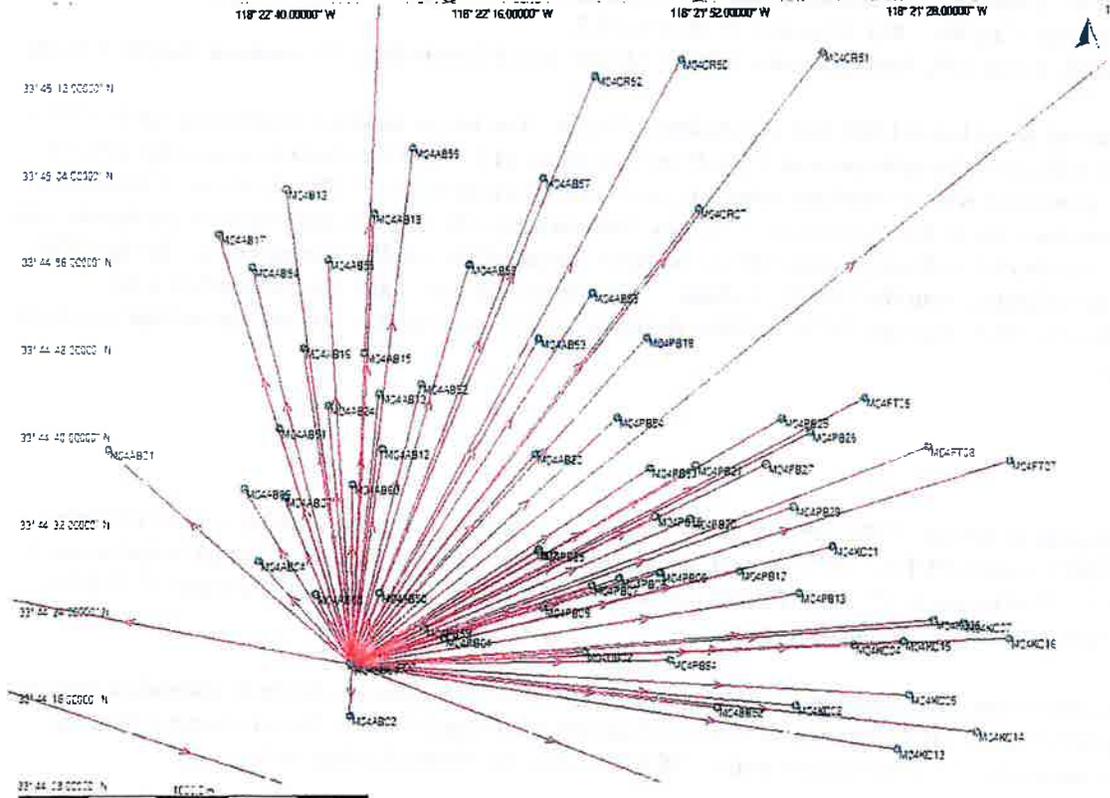

AB61, is the primary base station and sits on Portuguese Point. It is focal point of the static network connecting the monitoring points and CGPS Stations. A total of 65 on site points and 4 CGPS Stations were connected with 72 vectors measured 2-3 times to each point (159 total). See the Network Maps below.

McGEE SURVEYING CONSULTING

GPS Network with CGPS Stations (north up)

GPS Network Enlargement of Monitoring Points (north up)

MONITORING POINT STATUS

For data management purposes during the field survey and data processing, the point names are prefixed with "M04" i.e. AB61 is M04AB61 to distinguish between different monitoring periods. M04 indicates this survey is the fourth monitoring since the initial September 2007 Monitoring Survey when the program was modernized. This allows queries between epochs that include statistical information about accuracies. The prefix is stripped in the reports.

Since 1994, 149 monitoring points have been established in the Portuguese Bend area, many of which are now lost or destroyed. Sixty of the original points were recovered in 2007. Eight of the 60 points were deleted because they were in close proximity of other better suited for GPS leaving 52 points monitored for movement between September 2006 and September 2007. Three of the 52 points (AB09, KC11, PB51) were monitored in September 2007 for the last time because they were replaced by new points, set nearby and better suited for GPS. Eighteen new points set in 2007 had their movements reported for the first time in the December 2008 survey. In December 2008, 49 original and 18 points set in September 2007 were surveyed for a total of 67 monitoring points.

In the September 2007 Report, it was noted that KC01 was reported by the previous survey on 9/14/2006 to have moved N 29°E 1.24' from its 12/9/2005 position. This surveyor found a buried brass cap in concrete stamped "COUNTY ENGINEER RE8869 1956 STA ??IELDS" S31°29'W 1.48 feet from the 1" IP with steel guard post that was found in September 2007 and used on subsequent surveys. The original position of KC01 is adjusted in this Report to be consistent with the 1" IP, resulting in correct overall reported movements.

In the December 2008 Report, it was noted that AB05 had been previously disturbed by a mowing machine. AB05 was found chipped and leaning to southerly about 0.4'. The movement reporting resumed in 2009. Analysis of the present movement and historic data makes it possible to estimate the disturbance to within 0.05'. The original position of AB05 is adjusted S14°02'E 0.29' in this Report to be consistent with the disturbed position, resulting in correct overall reported movements.

In 2009, a new point PB64 was set east of the Archery Range to replace PB63 which had become unsafe to access. PB64 is reported for the first time in 2010 and PB63 was destroyed sometime in 2010.

In 2010, points AB03 and BB25 were deleted from the survey. AB03 was redundant and not moving and BB25 is on an apparently unstable rock affected by the surf. In the summer of 2010, PB62 was destroyed by road construction, and a new point PB65 was set 24' south-southwest. Movement will be reported for the first time in 2011. The following points may have been slightly disturbed. AB05 may have been disturbed by mower machinery and AB15 (a ½" GIP in a meter box) has been driven over recently by vehicles occasionally accessing an adjacent field.

The present status of monitored points is provided in the Appendix under "Monitoring Point Status as of October 2010".

ADJUSTMENTS & ANALYSIS

Adjustment 1: Minimally Constrained Adjustment processed to develop Geodetic and Ellipsoid Coordinates in NAD83 (2007.00)

Fixed Control: The CGPS Station PVE3 was fixed at its published three dimensional position in a Minimally Constrained Adjustment to determine latitude, longitude, ellipsoid heights, state plane coordinates, and to check other known points. PVE3 has been fixed in all adjustments since 2007. The CSRC publishes a Time Series for the horizontal and vertical stability of PVE3 which indicate the position has been stable over a ten year

McGEE SURVEYING CONSULTING

period to date. The other three CGPS Station positions determined by this and prior surveys relative to PVE3 are used to assess stability of the reference frame. The positions determined by this survey are based 6-11 hour measurement collected on four days over a six day period. The coordinate differences at other CGPS Stations from previous positions to the present are listed below in feet.

11/2009 Positions to 10/2010				9/2007 Positions to 10/2010			
Station	dN	dE	dZ	Station	dN	dE	dZ
PVE3	0.000	0.000	0.000	PVE3	0.000	0.000	0.000
PVHS	-0.002	0.001	-0.033	PVHS	-0.004	0.006	0.011
PVRS	-0.002	-0.001	-0.004	PVRS	-0.000	0.008	0.006
VTIS	-0.001	-0.003	0.005	VTIS	-0.003	0.005	-0.001
AB61	-0.009	-0.002	0.050	AB61	-0.019	0.011	0.005

The two dimensional (2D) differences from the November 2009 to the October 2010 measured positions of the three free CGPS Stations range 0.002 to 0.003 feet and 0.009 feet at AB61. Since the initial survey in 2007, the 2D difference range 0.006 to 0.008 feet at the CGPS and 0.022 feet at AB61. For the purpose of this survey, a constrained adjustment is not preferred as the purpose here is to track their relative stability which is within 0.01 feet. In addition to the CGPS, points AB02, AB17, AB61, and KC16 have a stable history. Their prior positions when compared to this survey indicate repeatability at the level of 0.01 feet as listed in the "FULL DATA POSTING".

The survey reference frame is deemed stable and successfully recovered at the level indicated. See the attached file "COORDINATE LIST-Oct 2010" for a list of coordinates resulting from this adjustment. See prior Reports for coordinates resulting from earlier surveys.

Adjustment 2: Minimally Constrained Adjustment processed to develop Orthometric Heights (Elevations) in NAVD88

Fixed Control: The CGPS Station PVE3 was fixed horizontally and vertically. The NAVD88 orthometric height of PVE3 was determined in the September 2007 survey based on the published 2nd Order NAVD88 Height of CGPS Station VTIS located 4.9 miles east-southeasterly. The Adjustment combined the measured ellipsoid height differences with the NGS Geoid 03 (models the separation between the ellipsoid and geoid surfaces) to determine NAVD88 orthometric heights of other CGPS Stations. The differences from prior surveys to the heights determined in the present survey are listed below in feet.

11/2009 to 10/2010			9/2007 to 10/2010		
PVE3	-0.000	Fixed	PVE3	-0.000	
PVHS	-0.033		PVHS	0.008	
PVRS	-0.004		PVRS	0.010	
VTIS	0.005		VTIS	-0.002	

Note: This survey checks from PVE3 to VTIS 0.005 feet in the present survey and -0.002 feet with the 2007 survey. See the attached file "COORDINATE LIST-Oct 2010 Survey" for a list of heights resulting from this survey.

ACCURACY

Movement Accuracy: For the movements reported in this period, the statistical analysis of points moving less than 0.3 feet returned a relative error at the 95% Level of Confidence averaging 0.026 feet with a standard deviation of 0.006 feet and a range of 0.005 to 0.037 feet. Overall, the relative error averaged 0.027 feet with a standard deviation of 0.006 feet and a range of 0.005 to 0.044 feet. No movement is considered detected unless the movement exceeds the 95% Error. See Page 4 of the "FULL DATA POSTING" for listing.

Vector Residuals: 159 measured vectors were processed in Adjustment #1 resulting in 72 vectors connecting 69 points. The two dimensional residuals and the absolute value of the vertical residuals are listed below in feet.

McGEE SURVEYING CONSULTING

	Two Dimensional Residuals			Vertical Residuals		
	Average	Std.Dev.	Maximum	Average	Std.Dev.	Range
Monitoring Pts	0.007	0.004	0.022	0.014	0.013	-0.05 to +0.06
CGPS Stations	0.005	0.003	0.012	0.023	0.022	-0.09 to +0.06

Note, if six of the twelve vectors connecting CGPS Station PVHS to the network were excluded the vertical residuals would range -0.027 to +0.032 feet for the other CGPS Stations indicating some signal interference is occurring; however, the horizontal position is considered reliable.

Vector Accuracy: The vector residuals at each point and the closures on stable control points discussed in "Adjustment 1" are good indications of the accuracies obtained by this survey. The lengths, precisions and relative distance errors resulting from the adjustment at the 95% Level of Confidence for the 72 vectors (baselines) are listed below in feet.

	Lengths		Precisions		Relative Dist. Error		Precision
	Vary	Average	Vary	Average	Average	Maximum	
Monitoring Pts	478-7134	3599	2.5-58.0	8.4 ppm	0.020	0.034	1: 180,000
CGPS Stations	9396-35386	22300	0.1- 0.4	0.2 ppm	0.004	0.004	1:5,575,000

The precision ratio based on the averages for the vectors connecting the Monitoring Points exceeds the criteria for a First Order (C-1) by a factor of 1.8, and the vectors connecting AB61 and the CGPS Stations exceeds the criteria for a B Order survey by a factor of 5.6 per the FGCS requirements for the former classification system.

Coordinate Accuracy: The Standard Deviations (68% Level of Confidence) the coordinates derived from Adjustment #1, relative to the CGPS Station PVE3 follow in feet.

	Monitoring Point	CGPS Stations				
		North	East	Up		
Standard Deviation Average	0.008	0.007	0.029	0.002	0.001	0.005
Standard Deviation Maximum	0.013	0.010	0.043	0.002	0.002	0.006

Absolute Coordinate Accuracy: The network accuracy is expected to be less than 0.02 feet horizontal relative to the NAD83 Datum based on the CGPS Station PVE3 fixed in Adjustment #1.

NAVD88 Heights: The North American Vertical Datum 1988 orthometric heights (elevations) resulting from Adjustment #2 are derived from the difference in ellipsoid heights combined with the Geoid 03 model and constrained to the orthometric height of PVE3. The ellipsoid heights are expected to be within 0.03 feet notwithstanding severely obstructed sites. The Geoid 03 model is expected to have a probable error of 1 part per million. Although relative elevation accuracies are expected to be 0.03+/- feet, there are no requirements for these surveys. The absolute accuracy of these heights is dependent on the published value on the CGPS Station VTIS.

This survey conforms to the intent of the Federal Geodetic Control Subcommittee (FGCS) Specifications for GPS Relative Positioning (1988) and the California Geodetic Control Committee (CGCC) Specifications for High-Production GPS Surveying Techniques (1993).

QAQC ANALYSIS

To ensure the accuracy and validity of the systems used to obtain the accuracies reported in these GPS surveys, an independent test was made using conventional terrestrial based instruments as reported in the "QAQC ANALYSIS" section of the September 2007 Monitoring Survey Report. The results found the GPS systems and conventional instrumentation horizontal measurements agreed 0.01 feet on average.

To validate the radial survey method of positioning points from a single base station (AB61), independent GPS cross connections were measured and compared with the computed inverse distances in 2007, 2008 and 2009

McGEE SURVEYING CONSULTING

surveys. See the "QAQC ANALYSIS" section of the September 2007 and the December 2008 Monitoring Survey Reports for detailed analysis. The results found the two dimensional accuracy to agree 0.01 feet on average, indicating the radial method of measurements is reliable and the extra labor cost of measuring cross connection between points is not warranted.

Deflection Analysis is used to assess the consistency of movements reported on prior surveys. Assuming that movements are generally linear over short distances, the separation can be implied as an indication of the survey accuracy of the reported movements. If the deflection or separation between the direction for the previous and present periods is equal to or less than 0.02 feet then it is considered linear. Of the 48 points with detected movements, 46 have a history and 33 points meet this criteria. Their deflection between the direction for the previous and present periods, taken over the moved distance, returned an average separation of 0.009 feet with a standard deviation of 0.006 feet and a maximum of 0.024 feet. Significant deflections noted at the following points should be reviewed by the City Geologist: AB15 moved 0.07 feet deflecting +52 degree, and CR07 moved 0.06 feet deflecting +41 degree.

SUMMARY

A modernization of field procedures and processing techniques began with the September 2007 survey. Thereafter, temporal movements are based on a rigorous simultaneous least squares adjustment of multiple observations at two different epochs on each point. The statistical results of the November 2009 to October 2010 monitoring period show the relative accuracy of the reported movements averages 0.026 feet at the 95% Level of Confidence. Prior to September 2007, successive coordinate differences were used to compute movements which did not provide statistical information about the relative accuracies.

Results of the adjustment indicate the probability at the 95% level of confidence that movement (signal) has occurred at a point when the horizontal distance between two epochs is greater than the 95% Error (noise) listed in the "Full Data Posting" (ranges 0.005 to 0.044 feet). Using these criteria, 17 points have not moved and 48 points have moved. Between November 2009 and October 2010 (11.25 months), points in the Portuguese Bend Landslide moved between 0.08 and 27.7 feet. Points in the Abalone Cove Landslide west of the Portuguese Bend Landslide moved between 0.04 and 0.14 feet. Points in the Klondike Canyon east of the Portuguese Bend Landslide moved between 0.03 and 0.07 feet. See the Contours of Horizontal Movement in the Appendix for a graphical representation of the movements across the site.

Velocity Analysis: The movement distances for points moving less than 0.3 feet in the present period (11.25 month) are 111% on average (30% std. dev.) of the movements for the previous period (11.3 months). The movement distances for points moving greater than 0.6 feet in the present period (11.25 month) are 194% on average (16% std. dev.) of the movements for the previous period (11.3 months). The City Geologist should be referred to for assessment and interpretation of the movements.

See the attached "FULL DATA POSTING" spreadsheet for overall and periodic movements of each point. The movements are given in north, east and up or down as well as a vector of distance and direction relative to north. The direction is given as an azimuth in degrees where 0° is north and increases clockwise (180° is south). The overall movements are from the beginning position of each point which varies between 1994 and 2007.

The present status of monitored points is provided in the Appendix under "Monitoring Point Status as of October 2010". The historical status of all monitoring points is provided in the September 2007 Survey Report. The historical 1994-2006 positions of all points are listed in the Charles Abbott Associates Inc. file "ALL POINTS MOST RECENT OBSERVED POSITION AS OF SEPTEMBER 15, 2006.xls" attached to the 2007 Report.

RECOMMENDATION

A program was discussed in the 2010 Planning Meeting for the replacement of Monitoring Monuments. Presently, monuments are within several feet of the surface and it has been recommended that deeper monuments be set that would be more reliable in detecting sub-surface movements. Many of the points should be moved to locations with less overhead obstructions and therefore more suitable for GPS observations. A few locations have safety issues and require time consuming traffic control during the survey. A re-location program will have long term benefits resulting in lower survey costs and a better understanding of sub-surface movements. Monuments suitable to this purpose would be of a design approved by the City Geologist and ACLAD.

PORTUGUESE POINT LANDSLIDE MONITORING

MAD83 (2007) COORDINATES and NAVD88 ELEVATIONS OF BEGINNING, 2007 & POST 2007 MONITORING POINT POSITIONS

Notes:

Indicates stable points, not moving

* Indicates no movement detected

1= 2005 and prior surveys used a nearby monument S31-29W 1.48", the original position is adjusted here to be relative to the 1" IP used presently, resulting in correct Overall Movements, see Reports

FULL DATA POSTING as of Dec. 2008
 Document Date: 12/08/10

Notes:

Indicates stable points, not moving

* Indicates no movement detected

2 = Hit by bower sometime between 09/07 and 12/08 with an estimated displacement S14E 0.29', the original position is adjusted here to be relative to monitored position used presently, resulting in correct Overall Movements; see Rpt.

COORDINATE LIST

Portuguese Landslide Monitoring Survey of October 25, 2010

Document Date: 12/11/2010

Datum: Horizontal & EH NAD83 (2007) Epoch: California State Plane Zone 5; Vertical: NAVD88

Note: Fixed CGPS Station PVE3 at Record 3D Position & Orthometric Height per 09/2007 Survey; See Survey Reports

Survey Report
of the
Portuguese Landslide November 2009 Monitoring Survey
for the
City of Rancho Palos Verdes
by
McGee Surveying Consulting

Surveyed by: McGee Surveying Consulting of Santa Barbara, CA, and Charles Abbott Associates, Inc.
Client: City of Rancho Palos Verdes; **Project Name:** Portuguese Bend Landslide Monitoring Program
Location: Rancho Palos Verdes, California; **County:** Los Angeles; **State:** California

PROJECT OVERVIEW:

McGee Surveying Consulting performed a slide monitoring and control survey at Portuguese Bend on behalf of the City of Rancho Palos Verdes in November 2009. The purpose of the survey was to establish accurate positions on monitoring points to determine overall and periodic movements. The results of this Survey are reported on spreadsheets described in this Report and attached hereto.

The field survey was planned, coordinated and executed by Michael McGee, PLS3945 of McGee Surveying Consulting of Santa Barbara, California in coordination with Frederick (Rick) Jones; P.E., P.L.S., City Engineer, City of Rancho Palos Verdes. Michael McGee PLS was responsible for the final processing of the observations, network adjustments, analysis and reports. The monitoring points cover approximately a 1½ mile square area and are measured annually or more often as necessary to determine the rate and extent of ground movement. Global Positioning System (GPS) technology is used for the purpose of determining positions based on the North American Datum of 1983 (NAD83) and the North American Vertical Datum of 1988 (NAVD 88) as referenced to the California CGPS (Continuous GPS) Stations in the region which are permanently mounted GPS receivers for monitoring seismic activity. The CGPS in California are similar to the national CORS (Continuously Operated Reference Stations).

Given that many points move an inch (0.08') or less per year, our requirement is to meet a relative accuracy standard of one centimeter (0.033 feet) at the 95% Level of Confidence. In the active slide area (central portion) where the movements are larger, two centimeters (0.066 feet) is sufficient. Field procedures are designed to accomplish this purpose and Quality Control-Quality Assurance (QAQC) processes discussed hereafter are incorporated to verify this accuracy is attained.

The movements reported between December 2008 and November 2009 (11.3 months) statistically attained accuracies of 0.02 feet at the 95% Level of Confidence as reported in the attached document "FULL DATA POSTING.xls". The actual accuracies of these measurements approach 0.01 feet in the horizontal as demonstrated by the measured vector residuals, repeatability of measurements at points considered stable, and the consistent direction of the movements reported from one period to the next. Refer to the sections titled ACCURACY and SUMMARY at the end of this Report for more details.

HISTORY

This survey is a continuation of a monitoring survey program initiated by the County of Los Angeles and taken over by the City of Rancho Palos Verdes circa 1994. McGee Surveying Consulting has conducted the field surveys and reporting since September 2007. See the Survey Reports for the September 2007 and December 2008 campaigns and the September 2007 Report for a detailed history of the previous survey process between 1994 and the September 2007.

PROJECT DATUMS, REFERENCE SYSTEM

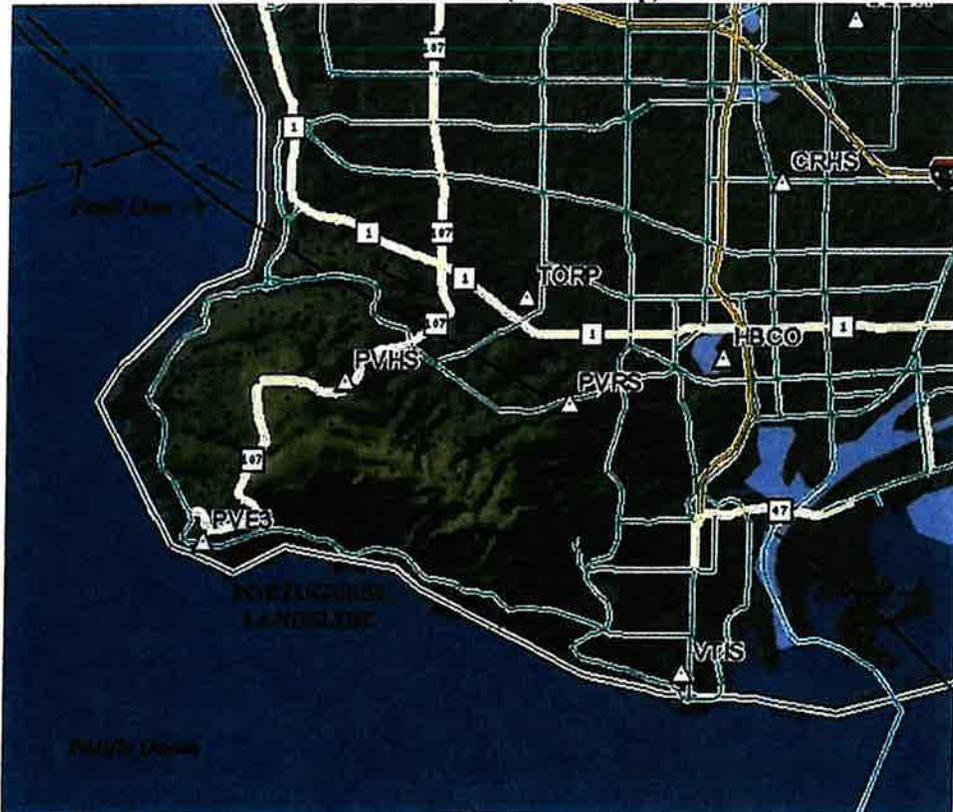

Horizontal Datum: North American Datum of 1983 (NAD83) per the National Geodetic Survey (NGS);
Epoch: 2007.00 referred to as NAD83(2007.00).; **Units:** Feet

Reference Network: The survey is referenced to the CGPS Stations which are continuously operating reference GPS receivers mounted on a stable platform (for more information see NGS Data Sheets for the PID's listed below). No data sheet exists for PVE3. The positions were obtained from the California Spatial Reference Center (CSRC). CSRC provides NGS sanctioned positions on all California CGPS Stations.

CGPS	Latitude (dms)	Longitude (dms)	EE (feet)	NGS PID	NAME
PVE3	33 44 35.853290	-118 24 15.269036	235.42	none	PALOS VERDES CORS
PVHS	33 46 46.020150	-118 22 19.741258	853.99	AJ1915	PENINSULA HIGH SCH
PVRS	33 46 25.891904	-118 19 14.067218	198.63	AJ1916	PALOS VERDES RES
VTIS	33 42 45.489584	-118 17 37.712290	197.52	AJ1936	MARINE EXCHANGE

Note: PVRS fall in the proximity of a Fault Line as shown below but appears unaffected to date

CGPS Stations (North is Up)

McGEE SURVEYING CONSULTING

Vertical Datum: North American Vertical Datum of 1988 (NAVD88) orthometric heights per NGS

Geoid Model: Geoid 03 (Geoid09 became available from the NGS in late 2009; however, using Geoid09 would not affect the results and Geoid03 is retained to be consistent with prior reported heights and the purpose of determining relative changes)

Reference Network: CGPS Station VTIS is the basis for this survey (see NGS Data Sheets)

CGPS	NAVD 88 Ht (feet)	
PVE3	none	
PVHS	972.1	Based on a Refined Geoid Model
PVRS	316.3	Based on a Refined Geoid Model
VTIS	315.26	Based on Second Order Leveling by CSRC and basis for this survey

Projection: NAD83 California State Plane Coordinates Zone 5: The State Plane Coordinates Parameters for Zone Five follow. The average Scale Factor is 1.00007543, the Ellipsoid Height Reduction Factor based on the average ellipsoid heights is 0.99999092, and the average Combined Grid Factor is 1.00006635. Distances in this survey are grid. To obtain ground distance divide the grid distances by the Combined Grid Factor. Grid bearings resulting from this survey must be rotated by a Convergence Angle to obtain geodetic (true) bearings. The average convergence angle is -0-12-30.2± (rotate left 0-12-30).

Datum Stability: The NAD83, 2007.00 Epoch adjustment is the latest in a series of adjustments of NAD83 since its adoption in 1986 and is the datum used for monitoring surveys since 2007. Rancho Palos Verdes sits on the Pacific Plate which is moving west-northwesterly relative to the North American Plate about 4 centimeters (0.14 feet) per year. The area southwesterly of the Fault Line shown on the above map includes the City and is moving at a constant rate as exhibited by the N, E, Up velocities of the CGPS Stations used in this survey, listed below. The CGPS Stations provide a rigid reference frame for the Portuguese Landslide Monitoring Program that is validated during each monitoring campaign. See the Minimally Constrained Adjustment results on Page 7 and the September 2007 Monitoring Survey Report by McGee Surveying Consulting for additional information.

Annual Velocities in Feet (2000-2010.04)

CGPS	North	East	Up
PVE3	0.064	-0.130	-0.001
PVHS	0.064	-0.128	0.000
PVRS	0.062	-0.128	0.001
VTIS	0.064	-0.128	-0.001

FIELD SURVEYS, DATA COLLECTION, EQUIPMENT & PROCESSING

Sixty-seven monitoring points were occupied and reported in November 2009. Site photographs and recovery sheets detailing the location, character of the monument and obstructions were updated. See the Appendix for "Monitoring Point Status as of November 2009" and "Monitoring Points Photo Update November 2009" for additional information. See the September 2007 and December 2008 Monitoring Survey Reports for all photos.

AB61, established in 2007 on Portuguese Point was used as a Base Station because of its suitability for GPS observations. The location is secured behind a locked gate, has a clear horizon above 15 degrees, and sits on a stable basalt geological formation.

The field survey commenced each day by setting a GPS receiver on a fixed height pole on AB61 while two GPS receivers roamed freely collecting observations on fixed height poles at the 66 other on-site points. Many of the points are over-shadowed by mature trees and shrubbery which interfere with signals received from satellites and affect the quality of measurements. To obtain the highest possible accuracies, satellites are compared with obstruction diagrams to estimate the best time for observing a point. Upon arriving at a point to be observed, the receiver is set up, and the location in the sky of each satellite is estimated with a compass and abney. Those

McGEE SURVEYING CONSULTING

satellites obstructed by foliage and trees are turned off. If 5 or more un-obstructed satellites with a GDOP (measure of the geometry of the constellation) of 4.5 or less are available, then the measurement commenced for 15-30 minutes of data collection. If sufficient satellites and geometry are not available, then the receiver is moved to the next point and returned later when satellite availability improves. This process is followed until all points are occupied twice under a different constellation of satellites on a different day. If the two measurements are within 0.03 feet in slow movement areas or 0.06 feet in active slide areas, then they are accepted, otherwise a third and sometimes fourth occupation is necessary.

Three Leica geodetic GPS receivers and antennas listed below were utilized to collect, process and store satellite signal data. Three, 2 meter fixed height poles were used for the base station and for the observations of the monitoring points. Prior to initiating the field observations a calibration of the fixed height poles was conducted with a theodolite to verify their height and plumb. The top of the poles were found to be plumb within 0.003 feet of the bottom consistent with prior years. Additional checks were made each day. There were no equipment failures.

GPS Survey Parameters:

Date of Field Surveys: 11/14/2009 to 11/20/2009 between 0700-1700 PST (+8 hrs for UTC).

Constellation: The NAVSTAR GPS constellation consisted of 30 Block II satellites.

GPS Observables: L1 & L2 Carrier Wave, C/A Code & P-Code; P-code was encrypted and SA off.

Epoch Rate & Occupation Times: 10 seconds for 15-30 minutes and 4-10 hours for CGPS connections.

Minimum Satellites: 5 ; GDOP < 4.5 ; Elevation Mask for Data Collection: 10 degrees; Processing: 10 deg.

Ephemeris: Broadcast and Precise for Static Post-Processing.

Weather conditions: Generally clear skies and mild temperatures.

Space Weather: Boulder K Index was 0-2 on a scale of 0-9 and gauges ionospheric activity.

GPS Base Receiver Unit No.: M1, Operator: M. McGee, PLS; Station Identification: AB61

Make & Model: Leica 530; Antenna Leica AT302; Mount: Fixed Height Pole #2; Antenna Height: 2.086m

GPS Rover Receiver Unit No.: M3, Operator: M. McGee, PLS;

Make & Model: Leica 530; Antenna Leica AT502; Mount: Fixed Height Pole #3; Antenna Height: 2.085m

GPS Rover Receiver Unit No.: M4, Operator: R. Reese, PLS,

Make & Model: Leica 530; Antenna Leica AT502; Mount: Fixed Height Pole #1; Antenna Height: 2.086m

Data was processed using Leica LGO post processing software. The long baseline connections to the CGPS were processed with a precise ephemeris and the short monitoring network baselines were processed with a broadcast ephemeris, both at a cutoff vertical angle of 10°. Analysis of processing statistics and residuals led to the rejection of 4 vectors. Network adjustments and analysis were performed with "Starnet-PRO" version 6.0 software. Data files for the CGPS Stations were downloaded from the following websites: Rinex files from CSRC/SOPAC, rapid and precise ephemeris from the NGS, and antenna models from the NGS .

NETWORK

The monitoring plan uses the CGPS Stations and those points deemed to be stable to verify the stability of the reference system. Relative to the Base Station point AB61, the CGPS Station PVE3 is located 1.8 miles west-northwest near City Hall, PVHS is 2.8 miles north, PVR3 3.9 miles northeast near a fault line, and VTIS is 4.9 miles east-southeast as shown on the Network diagram on the next page.

AB61, is the primary Base Station and sits on Portuguese Point. It is focal point of the static network connecting the monitoring points and CGPS Stations. A total of 68 on site points and 4 CGPS Stations were connected with 83 vectors measured 2-4 times to each point (197 measured vectors total). See the Network Maps below for points and vectors.

MONITORING POINT STATUS

For data management purposes during the field survey and data processing, the point names are prefixed with "M03" i.e. AB61 is M03AB61 to distinguish between different monitoring periods. This indicates this survey is the third monitoring since the initial September 2007 Monitoring Survey when the Program was modernized. This allows queries between epochs that include statistical information about accuracies. The prefix is stripped in the coordinate and movement listing reports.

Since 1994, 149 monitoring points have been established in the Portuguese Bend area, many of which are now lost or destroyed. Sixty of the original points were recovered in 2007. Eight of the 60 points were deleted because they were in close proximity of other better suited for GPS leaving 52 points monitored for movement between September 2006 and September 2007. Three of the 52 points (AB09, KC11, PB51) were monitored in September 2007 for the last time because they were replaced by new points, set nearby and better suited for GPS. Eighteen new points set in 2007 had their movements reported for the first time in the December 2008 survey. In December 2008, 49 original and 18 points set in September 2007 were surveyed for a total of 67 monitoring points.

One new point PB64 was set east of the Archery Range to replace PB63 which has become unsafe to access over waffled terrain. At the next Monitoring PB63 will be discontinued.

In the September 2007 Report, it was noted that KC01 was reported by the previous survey on 9/14/2006 to have moved N 29°E 1.24' from its 12/9/2005 position. This surveyor found a buried brass cap in concrete stamped "COUNTY ENGINEER RE8869 1956 STA ??IELDS" S31°29'W 1.48 feet from the 1" IP with steel guard post that was found in September 2007 and used on subsequent surveys. The original position of KC01 is adjusted in this Report to be consistent with the 1" IP, resulting in correct overall reported movements.

In the December 2008 Report, it was noted that AB05 had been previously disturbed by a mowing machine. AB05 was found chipped and leaning to southerly about 0.4'. The movement reporting resumes with this survey. Analysis of the present movement and historic data makes it possible to estimate the disturbance to within 0.05'. The original position of AB05 is adjusted S14°02'E 0.29' in this Report to be consistent with the disturbed position, resulting in correct overall reported movements.

The present status of monitored points is provided in the Appendix under "Monitoring Point Status as of November 2009".

ADJUSTMENTS & ANALYSIS

Adjustment 1: Minimally Constrained to develop Geodetic and Ellipsoid Coordinates in NAD83(2007.00)

Fixed Control: The CGPS Station PVE3 was fixed at its published three dimensional position in a Minimally Constrained Adjustment to determine latitude, longitude, ellipsoid heights, and state plane coordinates, and check other known points. The CSRC publishes a Time Series for the horizontal and vertical stability of PVE3 which indicate the position has been stable over a ten year period to date. The coordinate differences at other CGPS Stations from previous positions to the present are listed below in feet. See the attached file "COORDINATE LIST-Nov 2009" for a list of coordinates resulting from this survey.

Record Positions Compared to 12/2008

Station	dN	dE	dZ
PVE3	-0.000	-0.000	-0.000 Fixed
PVHS	0.004	-0.010	0.081
PVRS	0.017	0.002	-0.015
VTIS	0.005	0.006	-0.021

9/2007 Positions Compared to 11/2009

Station	dN	dE	dZ
PVE3	-0.000	-0.000	-0.000 Fixed
PVHS	-0.002	0.005	0.045
PVRS	0.001	0.009	0.010
VTIS	-0.003	0.007	-0.005

12/2008 Positions Compared to 11/2009

Station	dN	dE	dZ
PVE3	-0.000	-0.000	-0.000 Fixed
PVHS	-0.004	-0.001	0.015
PVRS	0.003	0.001	0.006
VTIS	-0.002	0.001	-0.002
AB61	-0.005	0.002	-0.007

The 2D differences from the December 2008 to the November 2009 measured positions of the CGPS Stations vary 0.002 to 0.004 feet, and for the purpose of this survey, a constrained adjustment is not preferred or necessary. The CGPS Station positions as determined by this and prior surveys relative to PVE3 are more useful than the record positions for determining the stability of PVE3. The positions determined by these surveys are based on a set of six measurement collected each day for about 10 hours over a six to seven day period during each campaign.

Points AB01, AB02, AB03, AB17, AB61, FT08, and KC16 are presently considered stable, given their history. The prior positions when compared to this survey indicate repeatability at the level of 0.01' as listed in the "FULL DATA POSTING". The survey reference frame is deemed stable and successfully recovered at the level indicated.

Adjustment 2: Minimally Constrained to develop Orthometric Heights (Elevations) in NAVD88

Fixed Control: The CGPS Station PVE3 was fixed horizontally and vertically at the NAVD88 height determined in September 2007 survey based on VTIS CGPS Station. The Adjustment combined the measured ellipsoid height differences with the NGS Geoid 03 (models the separation between the ellipsoid and geoid surfaces) to determine NAVD88 orthometric heights of all points. Prior surveys are compared with the heights determined in the present survey as listed below. See the attached file "COORDINATE LIST-Nov 2009 Survey" for a list of heights resulting from this survey.

09/2007 to 12/2008		12/2008 to 11/2009		9/2007 to 11/2009	
Station	dZ(ft)	Station	dZ(ft)	Station	dZ(ft)
PVE3	0.000	PVE3	-0.000	PVE3	-0.000
PVHS	0.031	PVHS	0.010	PVHS	0.041
PVRS	0.006	PVRS	0.008	PVRS	0.014
VTIS	-0.001	VTIS	-0.006	VTIS	-0.007
				AB61	-0.010

Note: The orthometric height of PVE3, established in September 2007 based on the published 2nd Order NAVD88 Height of VTIS located 35,386 feet east-southeasterly, is confirmed here at -0.007 feet.

ACCURACY

Coordinate Accuracy: In the Minimally Constrained Adjustment #1, the Standard Deviations (68% Level of Confidence) of the coordinates follow in feet.

	68 Monitoring Point				CGPS Stations		
	North	East	Up		North	East	Up
Average	0.006	0.005	0.021	Average	0.002	0.001	0.004
Maximum	0.009	0.008	0.032	Maximum	0.002	0.002	0.005

Absolute Coordinate Accuracy: The network accuracy is expected to be less than 0.02 feet horizontal relative to the NAD83 Datum based on the CGPS Station PVE3 fixed in Adjustment #1.

Relative Movement Accuracy: For the 67 movements reported here at the 95% Level of Confidence, the statistical analysis indicates the relative error averages 0.022 feet with a standard deviation of 0.004 feet and a range of 0.004 to 0.031 feet.

Vector Accuracy: 197 measured vectors were processed in Adjustment #1 resulting in 83 vectors connecting 72 points. The two dimensional residuals and the absolute value of the vertical residuals of the 197 vectors are listed below in feet. The vector residuals at each point and the closures on stable control points discussed in "Adjustment 1" are good indications of the accuracies obtained by this survey.

	Two Dimensional Residuals				Vertical Residuals		
	Average	Std.Dev.	Maximum		Average	Std.Dev.	Range
Monitoring Pts	0.006	0.004	0.020	0.01	0.01	-0.04 to +0.04	
CGPS Stations	0.005	0.004	0.017	0.02	0.016	-0.06 to +0.04	

The precisions and the relative distance errors resulting from the adjustment, at the 95% Level of Confidence, for the 83 vectors (baselines) connecting 72 points are listed below in feet.

	Lengths		Precisions		Relative Dist. Error		Precision
	Vary	Average	Vary	Average	Average	Maximum	
Monitoring Pts	192-7134	3484	1.5-63.0	5.9 ppm	0.013	0.023	1: 268,000
CGPS Stations	9396-35386	21519	0.1- 0.3	0.2 ppm	0.003	0.004	1:7, 173,000

The precision ratio based on the averages for the vectors connecting the Monitoring points exceeds the criteria for a First Order (C-1) by a factor of 2.7, and the vectors connecting AB61 and the CGPS Stations exceeds the criteria for a B Order survey by a factor of 7.2 per the FGCS requirements for the former classification system.

NAVD88 Heights: The North American Vertical Datum 1988 orthometric heights (elevations) resulting from Adjustment #2 are derived from the difference in ellipsoid heights combined with the Geoid 03 model and constrained to the orthometric height of PVE3. The ellipsoid heights are expected to be within 0.03 feet. The Geoid 03 model is expected to have a probable error of 1 part per million. Although relative elevation accuracies are expected to be 0.03+/- feet, there are no requirements for these surveys. The absolute accuracy of these heights is dependent on the published values on the CGPS Station VTIS.

This survey conforms to the intent of the Federal Geodetic Control Subcommittee (FGCS) Specifications for GPS Relative Positioning (1988) and the California Geodetic Control Committee (CGCC) Specifications for High-Production GPS Surveying Techniques (1993).

QAQC ANALYSIS

To ensure the accuracy and validity of the systems used to obtain the accuracies reported in these GPS surveys, an independent test was made using conventional terrestrial based instruments as reported in the "QAQC ANALYSIS" section of the September 2007 Monitoring Survey Report. The results found the GPS systems and conventional instrumentation horizontal measurements agree 0.01 feet on average.

McGEE SURVEYING CONSULTING

To validate the radial survey method of positioning points from a single base station (AB61), independent GPS cross connections were measured and compared with the computed inverse distances in the present and prior surveys as reported in the "QAQC ANALYSIS" section of the September 2007 and the December 2008 Monitoring Survey Report. The results find the two dimensional accuracy to agree 0.01 feet on average, indicating the radial method of measurements is reliable and the extra labor cost of measuring cross connection between all points is not warranted.

SUMMARY

A modernization of field procedures and processing techniques began with the September 2007 survey. The temporal movements are based on a rigorous simultaneous least squares adjustment of multiple observations on each point at two different epochs. The statistical results of the December 2008 to November 2009 monitoring period show the relative accuracy of the reported movements is 0.022 feet on average at the 95% Level of Confidence. Prior to September 2007, successive coordinates were used to compute movements which did not provide statistical information about the relative accuracy of the movements.

Analysis of the adjustment indicates the probability at the 95% level of confidence that movement (signal) has occurred at a point when the horizontal distance is greater than 0.02 feet (noise). Using these criteria, 15 points have not moved, BB25 moved in a direction inconsistent with the prior period, leaving 51 points that have moved. Between December 2008 and November 2009 (11.3 months), points in the Portuguese Bend Landslide moved between 0.10 and 7.30 feet. Points in the Abalone Cove Landslide west of the Portuguese Bend Landslide moved between 0.04 and 0.11 feet. Points in the Klondike Canyon east of the Portuguese Bend Landslide moved between 0.03 and 0.08 feet. See the Contours of Horizontal Movement in the Appendix for a graphical representation of the movements across the site.

Deflection Analysis: 49 of these points moved in a direction that was linear when compared with the previous period's direction of movement. The deflection or separation between the direction for the previous and present periods, taken over the moved distance, returned an average separation of 0.01 feet with a standard deviation of 0.01 feet. This implies the expectation that the direction of movement is linear unless acted upon by other forces. Furthermore, the 0.01 foot separation is an implied accuracy of the measurement of the reported movements.

Velocity Analysis: The movement distances for this period are 54% on average (12% standard deviation) of the movements for the last period; however, the 11.3 month period is 78% of the prior period. If the 54% average is normalized with the previous period ($.54/.78=.68$), then the movements have slowed about 1/3. The City Geologist should be referred to for assessment and interpretation of the movements.

See the spreadsheet "FULL DATA POSTING.xls" for overall and periodic movements of each point. The movements are given in north, east and up or down as well as a vector of distance and direction. The direction is given as an azimuth in degrees where 0° is north, 90° is east, 180° is south and 270° is west. The overall movements are from the beginning position of each point which varies between 1994 and 2007.

The present status of monitored points is provided in the Appendix under "Monitoring Point Status as of November 2009". The historical status of all monitoring points is provided in the September 2007 Survey Report. The historical 1994-2006 positions of all points are listed in the Charles Abbott Associates Inc. file "ALL POINTS MOST RECENT OBSERVED POSITION AS OF SEPTEMBER 15, 2006.xls" attached to the 2007 Report.

RECOMMENDATION

Monitoring Point AB03 on Portuguese Point should be deleted from the survey because it sits atop a high cliff subject to erosion and AB61 set nearby in 2007 is a suitable replacement. AB54 is one of the worst points for collecting GPS data. A suitable location may exist north-northeasterly about 300 feet on what may be City property. BB25 sits on a rock which appears to be unstable given its history of incongruous movements. It will be difficult to find a suitable nearby replacement along the shoreline.

Attachments: Find the following documents attached to this Report.

FULL DATA POSTING.xls - Lists the overall and periodic movements of monitoring point including coordinates of the initial positions, 2007 and post 2007 positions in NAD83(2007.00) and NAVD88 Systems

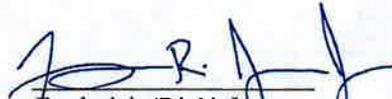

COORDINATE LIST-Nov 2009 Survey.xls - Current NAD83(2007.00) Geodetic, Grid Coordinates, NAVD88 Heights of all points

SURVEYOR'S STATEMENT

This Report on the criteria, procedures and results of the Rancho Palos Verdes Portuguese Landslide Monitoring Survey were prepared by me February 23, 2010 at the request of Frederick (Rick) Jones; P.E., P.L.S. of Charles Abbott Associates Inc. and City Engineer of the City of Rancho Palos Verdes.

Michael R. McGee
P.L.S. 3945

Frederick (Rick) Jones
R.C.E. 36665, P.L.S. 5458

APPENDIX

Find the following:

1. Contours of Horizontal Movements – Dec. 2008 to Nov. 2009 (Contours at 0.025, 0.10 and 1.00 feet providing a general visual representation of movements; see the City Geologist for interpretation of movements)
2. Contours of Horizontal Movements with Photo Overlay
3. Aerial Photo - Monitoring Point Locations
4. Aerial Photo – Regional View of Monitoring Points & CGPS Locations
5. Oblique View of Monitoring Points (North is up)
6. Monitoring Point Status as of November 2009
7. Monitoring Points Photo Update November 2009 (2 pages) (Updated photos for changes since Sept. 2007)

2. Contours of Horizontal Movements with Photo Overlay (North is left)
 (This is a general visual representation of movements; see the Full Data Posting for actual movements)

3. Aerial Photo - Monitoring Point Locations (North is left)

4. Aerial Photo – Regional View of Monitoring Points & CGPS Locations (North is up)

5. Oblique View of Monitoring Points (North is up)

McGEE SURVEYING CONSULTING

6. Monitoring Point Status as of November 2009
RANCHO PALOS VERDES - PORTUGUESE LAND SLIDE MONITORING

Notes: 150 Monitoring Points established since 1994
 09/2007 71 Points Monitored: 60 old points found with 52 monitored plus 19 new points
 12/2008 67 Points Monitored: AB09, KC11, PB51 discontinued; BB53 destroyed; AB05 disturbed
 11/2009 68 Points Monitored: Set PB64 new point to replace PB63

FULL DATA POSTING as of Dec.2008

Date: 02/09/10

Notes:

Indicates stable points, not moving

* Indicates no movement detected

2 = Hit by mower sometime between 09/07 and 12/08 with an estimated displacement S14E 0.29', the original position is adjusted here to be relative to monitored position used presently, resulting in correct Overall Movements, see Rpt

Survey Report

for the

Rancho Palos Verdes Portuguese Landslide December 2008 Monitoring and Control Survey

by

McGee Surveying Consulting

Surveyed by: McGee Surveying Consulting of Santa Barbara, CA, and Charles Abbott Associates, Inc.

Client: City of Rancho Palos Verdes; **Project Name:** Portuguese Bend Landslide Monitoring

Location: Rancho Palos Verdes, California; **County:** Los Angeles; **State:** California

PROJECT OVERVIEW:

McGee Surveying Consulting performed a ground slide monitoring and control survey at Portuguese Bend on behalf of the City of Rancho Palos Verdes in December 2008. The purpose of the survey was to establish high accuracy positions on monitoring points and determine the overall and periodical movements. This survey is a continuation of a monitoring survey program conducted by the City since 1994 and assumed by McGee Surveying Consulting in September 2007. The results of this Survey are reported on spreadsheets described in this Report and attached hereto.

The field survey was planned, coordinated and executed by Michael McGee, PLS3945 of McGee Surveying Consulting of Santa Barbara, California in coordination with Frederick (Rick) Jones; P.E., P.L.S., City Engineer, City of Rancho Palos Verdes. Michael McGee, PLS was responsible for the final processing of the observations, network adjustments and reports. The monitoring points cover approximately a 1½ square mile area and are measured annually or more often as necessary to determine the rate and extent of ground movement. Global Positioning System (GPS) technology was used for the purpose of determining positions based on the North American Datum of 1983 (NAD83) and the North American Vertical Datum of 1988 (NAVD 88) and are referenced to the CORS (Continuously Operated Reference Stations) which are permanently mounted GPS receivers. In California CORS are also referred to as CGPS or Continuous GPS stations.

This survey is required to meet a relative accuracy standard of two centimeters (0.066 feet) in the active slide area and one centimeter (0.033 feet) in other areas at the 95% Level of Confidence to ensure the reliability of the results. Field procedures are designed to accomplish this purpose and Quality Control-Quality Assurance (QAQC) processes are incorporated to verify this accuracy is attained. The movements reported between September 2007 and December 2008 (15 months) statistically attained accuracies of 0.02 feet at the 95% Level of Confidence. However, the results obtained at points believed to be stable and the fact that the directions of the present movements of the points are very similar to the overall movement directions are good indications that the accuracies of the movement measurements approach an unprecedented 0.01 feet in the horizontal.

HISTORY

This survey is a continuation of a monitoring program initiated by the County of Los Angeles and taken over by the City of Rancho Palos Verdes circa 1994. See the September 2007 Survey Report by McGee Surveying Consulting for a detailed History of the survey process between 1994 and the September 2007.

PROJECT DATUMS, REFERENCE SYSTEM

Horizontal Datum: North American Datum of 1983 (NAD83) per the National Geodetic Survey (NGS);
Epoch: 2007.00 referred to as NAD83(2007).; **Units:** Feet

Reference Network: The survey is referenced to the CORS Stations which are continuously operating reference GPS receivers mounted on a stable platform (for more information see NGS Data Sheets for the PID's listed below). No data sheet exists for PVE3. PVE3's position was downloaded from the California Spatial Reference Center (CSRC). CSRC provides NGS sanctioned positions on all California CORS.

CORS	Latitude (dms)		Longitude (dms)		SH (feet)	NGS PID	NAME		
	33	44	-118	24					
PVE3	33	44	35.853290	-118	24	15.269036	235.42	none available	PALOS VERDES CORS
PVHS	33	46	46.020150	-118	22	19.741258	853.99	AJ1915	PENINSULA HIGH SCH
PVRS	33	46	25.891904	-118	19	14.067218	198.63	AJ1916	PALOS VERDES RES
VTIS	33	42	45.489584	-118	17	37.712290	197.52	AJ1936	MARINE EXCHANGE

Regional CORS

Vertical Datum: North American Vertical Datum of 1988 (NAVD88) orthometric heights per NGS
Geoid Model: Geoid 03

Reference Network: CORS Station VTIS (see NGS Data Sheets)

CORS	NAVD 88 Ht.(feet)	
PVE3	none	
PVHS	972.1	Based on a Refined Geoid Model
PVRS	316.3	Based on a Refined Geoid Model
VTIS	315.26	Based on Second Order Leveling by CSRC and basis for this survey

Projection: NAD83 California State Plane Coordinates Zone 5: The State Plane Coordinates Parameters for Zone Five follow. The average Scale Factor is 1.00007543, the Ellipsoid Height Reduction Factor, based on the average ellipsoid heights is 0.99999092, therefore the average Combined Grid Factor is 1.00006635. Multiply the Combined Factor times ground distances to obtain grid distances relative to this survey. Grid bearings resulting from this survey must be rotated by a Convergence Angle to obtain geodetic (true) bearings. The average convergence angle is -0-12-30.2±.

Datum Notes: The NAD83, 2007.00 Epoch adjustment is the latest in a series of adjustments of NAD83 since its adoption in 1986 and is the datum for all monitoring surveys since 2007. Rancho Palos Verdes sits on the Pacific Plate which is moving west-northwesterly relative to the North American Plate about 4 centimeters (0.13 feet) per year; however, the City as a whole is moving at a constant rate as exhibited by the N, E, Up velocities of the CORS, shown below, which serve as a rigid reference frame for the Portuguese Landslide Monitoring. See the September 2007 Survey Report by McGee Surveying Consulting for additional information.

Annual Velocities in Feet			
CORS	North	East	Up
PVE3	0.06	-0.13	-0.01
PVHS	0.06	-0.13	-0.01
PVRS	0.06	-0.13	-0.00
VTIS	0.06	-0.13	-0.01

FIELD SURVEYS, DATA COLLECTION, EQUIPMENT & PROCESSING

Sixty-seven monitoring points were occupied and reported in December 2008. Site photographs and recovery sheets detailing the location, character of the monument and obstructions were updated. See the Appendix for "Monitoring Point Status as of December 2008" and "Monitoring Point Photos - Update December 2008 in the for additional information. See the September 2007 Survey report for photos of all points.

AB61, established in 2007 on Portuguese Point as a permanent GPS Base Station, was occupied as a base for this survey. The location is secured behind a locked gate, has a clear horizon above 15 degrees, and sits on a stable basalt geological formation.

The field survey commenced each day by setting up a GPS receiver on a tripod at AB61 while two GPS receivers roamed freely collecting observations on fixed height poles at the 66 on-site points. Many of the points are surrounded by mature trees and plants which attenuate satellite signals passing through foliage degrading the measurement accuracies. To obtain the highest possible accuracies, available satellites are compared in real time with the obstruction diagrams to estimate the best time for observing a point. Upon arriving at a point to be observed, the receiver is set up, the location in the sky of each satellite is estimated with a compass and abney, and those satellites obstructed by foliage and trees are turned off. If 5 or more un-obstructed satellites with a GDOP (measure of the geometry of the constellation) of 4.5 or less were available then the measurement commenced for 15-30 minutes of data collection. If sufficient satellites and geometry were not available then the receiver was moved to the next point and the point was returned to later. This process was followed until all points were occupied twice under a different constellation of satellites. If the two measurements were not in agreement, then a third occupation was made.

Three Leica geodetic GPS receivers and antennas listed below were utilized to collect, process and store satellite signal data. Two, 2 meter fixed height poles were used for the field observations of the monitoring points with a base station receiver utilizing a tribrach on tripod setup. Prior to initiating the field observations a calibration of the tribrach and fixed height poles was conducted to verify the accuracy of the equipment. There were no equipment failures. See below for the GPS Survey Parameters.

Date of Field Surveys: 12/07/2008 to 12/13/2008 between 0700-1700 PST (+8 hrs for UTC).
Constellation: The NAVSTAR GPS constellation consisted of 31 Block II satellites.
GPS Observables: L1 & L2 Carrier Wave, C/A Code & P-Code; P-code was encrypted and SA off.
Epoch Rate & Occupation Times: 10 seconds for 15-30 minutes and 4-10 hours for CORS connections.
Minimum Satellites: 5 ; GDOP < 4.5 ; Elevation Mask for Data Collection: 15 degrees; Processing: 15 deg.
Ephemeris: Rapid for Static Post-Processing.
Weather conditions: Generally clear skies and mild temperatures.
Space Weather: Boulder K Index was 0-2 on a scale of 0-9 and gauges ionospheric activity.
GPS Base Receiver Unit No.: M1, Operator: M. McGee, PLS; Station Identification: AB61
Make & Model: Leica 530; Antenna Leica AT302; Mount: Tribrach on Tripod; Height: varies
GPS Rover Receiver Unit No.: M3, Operator: M. McGee, PLS;
Make & Model: Leica 530; Antenna Leica AT502; Mount: Fixed Height Pole #1; Antenna Height: 2.082m
GPS Rover Receiver Unit No.: M4, Operator: R. Reese, PLS,
Make & Model: Leica 530; Antenna Leica AT502; Mount: Fixed Height Pole #3; Antenna Height: 2.083m

A total of 67 on site points and 4 CORS were connected with 164 measured vectors. Data was processed using the Leica LGO post processing software. The baseline connections to the CORS were processed with a rapid ephemeris and the monitoring network baselines were processed with a broadcast ephemeris, both at a cutoff vertical angle of 15°. Analysis of processing statistics and residuals led to the rejection of 2 vectors. Network adjustments and analysis were performed with "Starnet-PRO" version 6.0 software. The CORS stations were included by downloading Rinex files from the NGS and using the NGS antenna models in the processing.

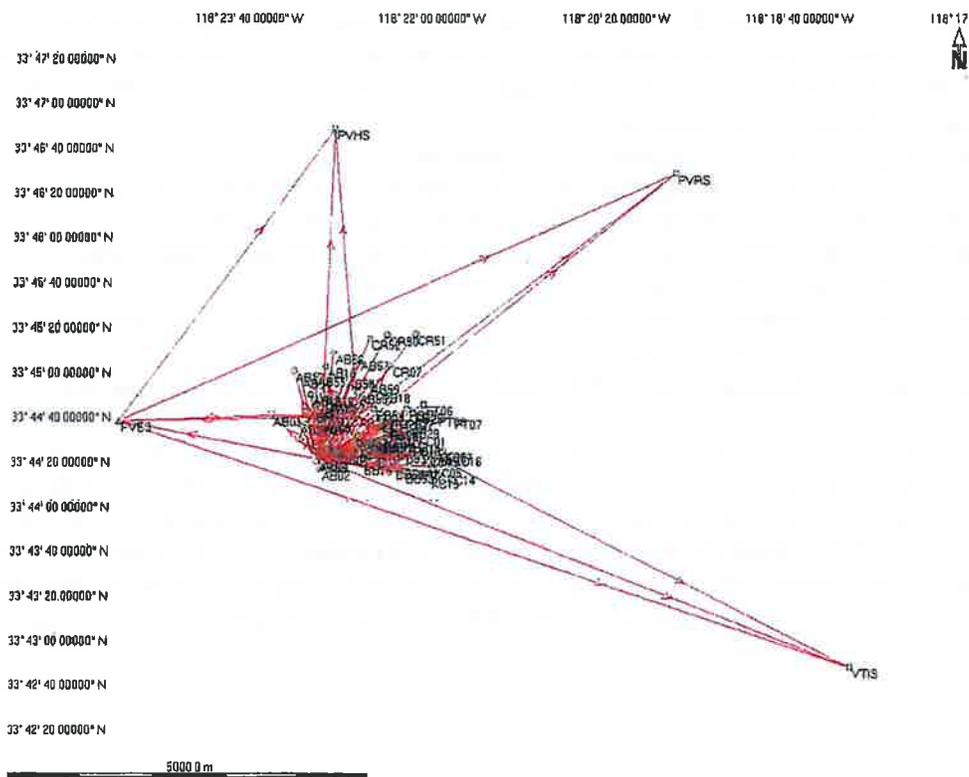

NETWORK

AB61 is the primary Base Station monument on Portuguese Point which is the focal point of a static network connecting the 67 monitoring points and four CORS control points as shown below. Since 1994, 149 monitoring points have been established in the Portuguese Bend area, many of which are now lost or destroyed. Sixty of the original points were recovered in 2007. Eight of the 60 points were deleted because they were in close proximity of other better suited for GPS leaving 52 points monitored for movement between September 2006 and September 2007. Three of the 52 points (AB09, KC11, PB51) were monitored in 2007 for the last time because they were replaced by new points, better suited for GPS, set nearby. Eighteen new points set in 2007 have their movements reported for the first time in this December 2008 survey. In December 2008, 49 original and 18 points set in September 2007 were surveyed for a total of 67 monitoring points.

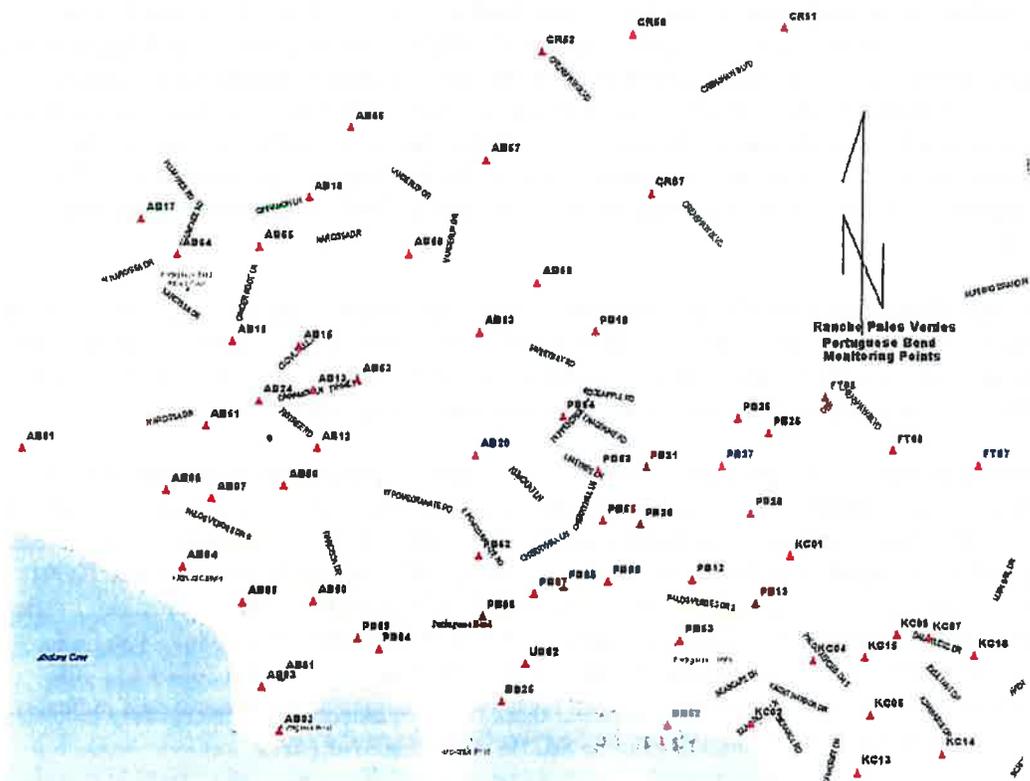

Monitoring Points: Points take their ID from previous surveys. For data management purposes the point ID's were prefixed in this survey with "M02" i.e. AB61 is M02AB61. This is to indicate the survey is the second monitoring since the initial September 2007 Monitoring Survey when the Monitoring Program was modernized. The prefix is stripped in the coordinate and movement listing reports.

BB53 was destroyed by wave action since the September 2007 Survey. The overall movement of point BB25 is referenced to the 11/04/1998 position because the position changed 6 feet west of its first reported position on 12/13/1997, further review of the history and the direction of its recent movement suggest that wave action may affect the stability of this point. In the September 2007 Report, it was noted that KC01 was reported by the previous surveyor on 9/14/2006 to be N29°E 1.24' from the 12/9/2005 position. After completion of this survey, a brass cap in concrete stamped "COUNTY ENGINEER RE8869 1956 STA ??IELDS" was found S46°W 1.47 feet from the 1" GIP found in 2007 and used for the 2007 and 2008 Reports. Analysis of the distance and direction between these two monuments, and historic data indicates the overall movement at this location since 1997 to be S63°W 0.78 feet +/-0.1 feet.

ADJUSTMENTS & ANALYSIS

Adjustment 1: Minimally Constrained to develop Geodetic and Ellipsoid Coordinates in NAD83(2007)

Fixed Control: The CORS PVE3 was fixed at its published three dimensional position in a Minimally Constrained Adjustment to determine latitude, longitude, ellipsoid heights, and state plane coordinates, and check other known points shown below. See the attached file "COORDINATE LIST-Dec 2008 Survey.xls" for a list of coordinates which are the basis for computing future movements.

The 3D and Ellipsoid Height adjustment results follow with coordinate differences (closures) from previous positions to the present in feet. The differences with the September 2007 positions determined by this surveyor are smaller than the differences with the record positions, and are a better indicator of the accuracy and repeatability of this survey. The differences with the record are similar to those reported in 2007.

Sept. 2007 to Dec. 2008				NGS Record Positions to Dec. 2008					
	Station	dN	dE	dZ		dN	dE	dZ	
Fixed	PVE3	0.000	0.000	0.000	Fixed	PVE3	0.000	0.000	0.000
	PVHS	0.002	0.006	0.034		PVHS	0.006	-0.011	0.067
	PVRS	-0.002	0.007	0.002		PVRS	0.010	-0.004	-0.030
	VTIS	-0.001	0.006	0.000		VTIS	0.006	0.003	-0.012

Notes/Comments: Relative to the primary Base Station point AB61, the CORS station PVE3 is located 1.8 miles west-northwest, PVHS is 2.8 miles north, PVRS 3.9 miles northeast and VTIS is 4.9 miles east-southeast. The 2D closures on the CORS are 0.007 feet or less, and for the purpose of this survey a constrained adjustment was not computed. The monitoring plan is to use the CORS and those points deemed to be stable over time to verify the stability of the reference system.

Below are differences in feet from the September 2007 positions to the present surveyed positions of select points. Points believed to be stable are listed first, followed by those that did not appear to have moved because the difference is less than 0.02 feet. These points will be reviewed with the next monitoring. Points AB02, AB03 and AB17, considered stable, agree on average +0.000 north, -0.004 east, and -0.015 up. PVE3 was fixed in this adjustment because it is in better agreement with these three points than AB61 (Base) which is -0.005 north, +0.010 east, and -0.037 up. The survey reference frame is deemed stable and successfully recovered. AB61 will be watched.

Point	N	E	Up
Stable Points			
AB01	-0.012	-0.015	-0.038
AB02	0.004	-0.008	-0.019
AB03	0.001	-0.002	-0.018
AB17	-0.005	-0.001	-0.009
CR52	-0.003	-0.014	0.009
No Movement Detected			
AB54	-0.010	0.003	-0.015
AB61	-0.005	0.010	-0.037
CR50	0.008	0.009	0.046
CR51	-0.011	0.002	-0.013
FT08	-0.009	0.020	0.032
KC07	0.002	0.019	-0.002
KC14	-0.003	-0.015	-0.025
KC16	-0.005	0.005	0.015

New Base Station Established in 2007

Adjustment 2: Minimally Constrained to develop Orthometric Heights (Elevations) in NAVD88

Fixed Control: The CORS PVE3 was fixed horizontally and vertically at the NAVD88 height determined in September 2007 survey, in a Minimally Constrained Adjustment that combined the measured ellipsoid height differences with the NGS Geoid 03 (models the undulations between the ellipsoid and geoid surfaces) to determine NAVD88 orthometric heights on all points. These results are compared with other known points shown below. See the attached file "COORDINATE LIST-Dec 2008 Survey.xls" for a list of heights which is the basis for computing future movements.

NAVD88 Orthometric Height adjustment results follow with the height differences (closures) from the September 2007 surveyed heights to the heights determined in the present survey.

<u>Station</u>	<u>dZ (ft)</u>	
PVE3	0.000	Fixed
PVHS	0.031	
PVRS	0.006	
VTIS	-0.001	

Notes/Comments: The orthometric height of PVE3 was established in September 2007 based on the published NAVD88 Height of VTIS, and is confirmed here at 0.001 feet.

ACCURACY

Relative Accuracy: On site the points are expected to be 0.02 feet or less at the 95% Level of Confidence.

Absolute Accuracy: The network accuracy is expected to be less than 0.02 feet horizontal relative to the NAD83 Datum based on the PVE3 CORS Station as fixed in Adjustment #1.

Vector Residuals: For the monitoring points in Adjustment #1, referred to above, the two dimensional horizontal residuals average 0.006 feet with a standard deviation of 0.004 feet and a maximum of 0.021 feet. The absolute value of the vertical residuals average 0.013 feet with a standard deviation of 0.013 feet and a range between -0.058 and +0.066 feet. For the CORS points, the two dimensional horizontal residuals average 0.005 feet with a standard deviation of 0.003 feet and a maximum of 0.012 feet. The absolute value of the vertical residuals average 0.018 feet with a standard deviation of 0.015 feet and a range between -0.047 and +0.059 feet.

NAVD88 Heights: The North American Vertical Datum 1988 orthometric heights (elevations) resulting from Adjustment #2 are derived from the GPS ellipsoid heights combined with the Geoid 03 model and constrained to known elevations. The ellipsoid heights are expected to be within 0.03 feet. The Geoid 03 model is expected to have a probable error of 1 part per million. Relative elevation accuracies are expected to be 0.03-0.04 feet. The absolute accuracy of these heights is dependent on the published values on the VTIS CORS.

Measurement Precisions: The vectors (baselines) for all points vary in length between 192 feet and 26,103 feet and averaging 3979 feet. The vector precisions at the 95% Level of Confidence (2 sigma) vary 0.2 ppm to 69 ppm and average 7.8 ppm. The relative distance error at the 95% Level of Confidence averages 0.018 feet with a maximum of 0.028 feet. The precision ratio based on the averages is 1:221,000 exceeding the criteria for a First Order (C-1) survey per the FGCS requirements by a factor of two under the former classification system.

The vectors connecting AB61 to the CORS vary in length between 9,395 and 26,103 feet and average 7,217 feet. The precisions, at the 95% Level of Confidence (2 sigma), vary 0.2 ppm to 0.4 ppm and average 0.3 ppm for 4 vectors measured over a 6 day period each. The relative distance error at the 95% Level of Confidence averages 0.004 feet with a maximum of 0.006 feet. The precision ratio is 1:1,800,000 exceeding the criteria for a B Order survey per the FGCS requirements for the former classification system..

The residuals and the closures between known control points discussed in the above Adjustments are good indications of the accuracies obtained by this survey. This survey conforms to the intent of the Federal Geodetic Control Subcommittee (FGCS) Specifications for GPS Relative Positioning (1988) and the California Geodetic Control Committee (CGCC) Specifications for High-Production GPS Surveying Techniques (1993).

QAQC ANALYSIS

To ensure the accuracy and validity of this process, an independent test of the methods used in these surveys was made by using conventional instrumentation. See the September 2007 Monitoring Survey Report under QAQC for the analysis and results that support the use of GPS techniques to obtain the accuracies reported in these surveys.

To validate the present survey, the inverse distance between the GPS positions of AB20 and four other points spread across the site were computed and then compared with the direct single independently measured GPS vectors as listed below.

Comparison of Computed GPS Distances v. Direct GPS Measurements

<u>From-To</u>	<u>Calculated Bearing & Distance</u>		<u>Measured Bearing & Distance</u>	
AB20-AB55	N46-47-47.3W	2651.040	N46-47-47.6W	2651.024
AB20-AB60	S80-57-37.2W	1719.811	S80-57-35.5W	1719.810
AB20-FT06	N80-50-32.4E	3113.870	N80-50-32.5E	3113.871
AB20-PB62	S02-02-37.4E	883.982	S02-02-37.0E	883.988

The difference in the distances average 0.006 feet with a maximum of 0.016 feet. The differences in the bearings are comparable. This test indicates the accuracies in a two dimensional sense are 0.009 feet or 0.017 feet at the 95% level of confidence. This test indicates the radial method of positioning monitoring points is reliable at 0.01 feet, more than sufficient for monitoring purposes.

SUMMARY

A modernization of field procedures and processing techniques began with the September 2007 survey. The present movements are based on a rigorous simultaneous adjustment of the September 2007 and the December 2008 surveys, resulting in measured movement reliability of 0.02 feet at the 95% Level of Confidence for this period. Statistical analysis of the data indicates the probability that movement has occurred when the distance is greater than 0.02 feet and the direction is consistent with the direction of the overall movement for a particular point. The results of this survey find the periodic movement direction to be generally within 10° of the overall movement direction. The overall and periodic movements are given in north, east and up or down as well as a vector of distance and direction. The direction is given as an azimuth in degrees where 0° is north, 90° is east, 180° is south and 270° is west. See the spreadsheet "FULL DATA POSTING.xls" for the overall and periodic movements, and the coordinates used to compute movements. The overall movements are from the beginning positions which vary between 1994 and 2005.

Between September 2007 and December 2008 (14.5 months) the points in the Portuguese Bend Landslide moved between 0.20 and 9.73 feet. Points in the Abalone Cove Landslide west of the Portuguese Bend Landslide moved between 0.05 and 0.17 feet. Points in the Klondike Canyon east of the Portuguese Bend Landslide moved between 0.03 and 0.13 feet. See the Contours of Horizontal Displacement in the Appendix for a graphical representation of the movements across the site. The City Geologist should be referred to for assessment and interpretation of the movements.

The present status of all monitoring points is given in the Appendix under "Monitoring Point Status as of December 2008". The historical status of all monitoring points is given in the September 2007 Survey Report. The historical 1994-2006 positions of all points are listed in the Charles Abbott Associates Inc. file "ALL POINTS MOST RECENT OBSERVED POSITION AS OF SEPTEMBER 15, 2006.xls".

FULL DATA POSTING as of Dec.2008

Date: 01/30/09

Notes:

Indicates stable points, not moving

* Indicates no movement detected

Notes: 2 = Hit by mower between 09/07 and 12/08, displaced southerly about 0.4', to be reported next period

September 2007 Monitoring and Control Survey
by
McGee Surveying Consulting

Surveyed by: McGee Surveying Consulting of Santa Barbara, CA, and Charles Abbott Associates, Inc.
Client: City of Rancho Palos Verdes; **Project Name:** Portuguese Bend Landslide Monitoring
Location: Rancho Palos Verdes, California; **County:** Los Angeles; **State:** California

PROJECT OVERVIEW:

McGee Surveying Consulting performed a ground slide monitoring control survey at Portuguese Bend on behalf of the City of Rancho Palos Verdes in September 2007. The purpose of the survey was to establish high accuracy positions on monitoring points, determine the overall and periodical movements and convert from the old North American Datum of 1927 to the new North American Datum of 1983 coordinate system. This survey is a continuation of a monitoring survey program conducted by the City since 1994 and assumed by McGee Surveying Consulting in September 2007. The results of this Survey are reported on spreadsheets described in this Report and attached hereto.

The field survey was planned, coordinated and executed by Michael McGee, PLS3945 of McGee Surveying Consulting of Santa Barbara, California in coordination with Frederick (Rick) Jones; P.E., P.L.S., City Engineer, City of Rancho Palos Verdes. Michael McGee, PLS was responsible for the final processing of the observations, network adjustments and reports. The monitoring points cover approximately a 1½ square mile area and are measured annually or more often as necessary to determine the rate and extent of ground movement. Global Positioning System (GPS) technology was used for the purpose of determining positions based on the North American Datum of 1983 (NAD83) and the North American Vertical Datum of 1988 (NAVD 88) and are referenced to the CORS (Continuously Operated Reference Stations) which are permanently mounted GPS receivers.

To ensure the accuracy of the process and results, this survey was required to meet a relative accuracy standard of two centimeters (0.066 feet) in the active slide area and one centimeter (0.033 feet) in other areas at the 95% Level of Confidence. Field procedures were designed for this purpose and Quality Control-Quality Assurance (QAQC) processes were incorporated to verify this accuracy was attained. The 2007 adjustment results discussed hereafter returned horizontal and vertical accuracies averaging 0.01 feet and relative accuracies of 0.02 feet at the 95% Level of Confidence.

HISTORY

This survey is a continuation of a monitoring program initiated by the County of Los Angeles and taken over by the City of Rancho Palos Verdes circa 1994. Between 1994 and September 2006, a GPS Base Station receiver was set at AB01 on the westerly side of the project while GPS receivers occupied other points during monitoring surveys. AB01 was fixed at a WGS84 position apparently based on a navigation position

discussed hereafter. The observations were processed in Leica software to develop geodetic coordinates of latitudes, longitudes and ellipsoid heights. These geodetic coordinates were imported into a Corps of Engineers software program called Corpscon as NAD83 geodetic coordinates and exported as NAD27 State Plane Coordinates System in Zone 7. Corpscon calls the program NADCON which uses a database of the nearest points with coordinates common to both the old NAD27 and new NAD83 system to compute a transformation. The NGS NADCON program has been used for this purpose up through 2007. Although the absolute accuracy of the NADCON conversions is a ½ foot or less, the local relative accuracies are about 0.05 feet. The NAD27 State Plane Coordinates were then compared year over year to report ground movements. See the "STATUS OF MONITORING POINTS" in the Appendix for a historical list of all monitoring points and their status as of September 2007.

PROJECT DATUMS, REFERENCE SYSTEM

This September 2007 Survey reports coordinates, elevations and movements in NAD27 (horizontal) and NGVD29 (vertical) for the last time, and in NAD83 and NAVD88 for the first time and going forward in time.

Datum for Reporting the 2007 and Future Surveys

Horizontal Datum: North American Datum of 1983 (NAD83) per the National Geodetic Survey (NGS)
Epoch: 2007.00 referred to as NAD83(2007) or NAD83(NSRS2007); **Units:** Feet

Reference Network: The survey is referenced to the CORS Stations which are continuously operating reference GPS receivers mounted on a stable platform (for more information see NGS Data Sheets for the PID's listed below). No data sheet exists for PVE3. PVE3's position was downloaded from the California Spatial Reference Center (CSRC). CSRC provides NGS sanctioned positions on all California CORS.

CORS	NAD83 (2007)		Elev (feet)	NGS PID	NAME
	Latitude (Dms)	Longitude (Dms)			
PVE3	33 44 35.853290	-118 24 15.269036	235.42	no data sheet	PALOS VERDES CORS
PVHS	33 46 46.020150	-118 22 19.741258	853.99	AJ1915	PENINSULA HIGH SCH
PVRS	33 46 25.891904	-118 19 14.067218	198.63	AJ1916	PALOS VERDES RES
VTIS	33 42 45.489584	-118 17 37.712290	197.52	AJ1936	MARINE EXCHANGE

Regional CORS in the Vicinity of Rancho Palos Verdes

Vertical Datum: NAVD88 per NGS

Geoid Model: Geoid 03

Reference Network: CORS Station VTIS (see NGS Data Sheets)

<u>CORS</u>	<u>Elevation(feet)</u>	
PVE3		Not Available
PVHS	972.1	Based on a Refined Geoid Model
PVRS	316.3	Based on a Refined Geoid Model
VTIS	315.26	Based on Second Order Leveling by CSRC

Projection: NAD83 California State Plane Coordinates Zone 5

State Plane Coordinates Parameters for Zone Five: The average Scale Factor is 1.00007543, the Ellipsoid Height Reduction Factor, based on the average ellipsoid heights is 0.99999092, therefore the average Combined Grid Factor is 1.00006635. Multiply the Combined Factor times ground distances to obtain grid distances relative to this survey. Grid bearings resulting from this survey must be rotated by a Convergence Angle to obtain geodetic (true) bearings. The average convergence angle is -0-12-30.2±.

Datum for Reporting the 2007 and Prior Surveys

Horizontal Datum: World Geodetic System of 1984 (WGS84)

Reference Network: AB01

<u>Point</u>	<u>Latitude</u>	<u>Longitude</u>	<u>EH(feet)</u>	
AB01	33-44-38.28119	-118-22-53.02044	34.065	Historical Record

Vertical Datum: National Geodetic Vertical Datum of 1929 (NGVD 29)

Reference Network: AB01

<u>CORS</u>	<u>Elevation(feet)</u>	
AB01	176.06	Historical Record

Projection: NAD27 Calif. State Plane Coordinates Zone 7

NAD27 State Plane Coordinates Parameters for Zone Seven: the average Scale Factor is 1.00001261, the Elevation Reduction Factor based on the average elevation above sea level is 0.99998585, the average Combined Grid Factor is 0.99999846. Multiply the Combined Factor times ground distances to obtain grid distances. Grid bearings are rotated by a Convergence Angle to obtain geodetic bearings. The average convergence angle is -0-01-05.3±.

Datum Notes/Comments:

Horizontal positions and ellipsoid heights are referenced to the North American Datum of 1983 (NAD83), 2007.00 Epoch adjustment of the National Spatial Reference System (NSRS) based on the four CORS listed above. NAD83 superseded the North American Datum of 1927 (NAD27) in 1986. The original NAD83 adjustment is based on earlier conventional survey measurements and triangulation networks referenced to a global network. With the advent of GPS technology, a High Precision Geodetic Network (HPGN) was established in California in 1991. The most recent realization of NAD83, used by this survey, is based on an extremely precise adjustment of the national CORS network. The shift from NAD27 to NAD83 in this vicinity is -6 feet in latitude and -275 feet in longitude.

Orthometric heights (elevations) are based on the North American Vertical Datum of 1988 (NAVD 88) as determined by the NGS on the CORS station "VTIS". The NAVD 88 vertical datum superseded the National Geodetic Vertical Datum of 1929 (NGVD 29) in 1991. The NGVD 29 datum was originally intended to approximate local sea level and differs from NAVD88 by about 3 feet in California. An NGS program called Vertcon computes the shift between datums with an estimated accuracy of about 2 centimeters (0.06 feet). The Vertcon computed shift from the NAVD 88 to NGVD 29 at AB01 is -2.43 feet (-0.741 meters), and the difference between the NGVD29 value used historically for AB01 and the NAVD88 determined by this survey is -2.56 feet.

RELATIONSHIPS: GPS positions are reported as coordinates in a three dimensional X, Y, Z Cartesian Coordinate System with the origin 0,0,0 being earth-centered and earth-fixed. These coordinates are converted for mapping purposes to geodetic coordinates of latitude, longitude and ellipsoid heights which are further converted to plane or grid coordinates for local applications. The GPS satellite positions are in the military World Geodetic System of 1984 (WGS84). The parameters and orientation of the ellipsoid for NAD83 and WGS84 are for practical purposes the same; however NAD83 unlike WGS84 is not geocentric and the same position in both systems will differ about 4 feet on the ground. NAD83 positions are realized by attaching WGS84 measured vectors to NAD83 reference points (CORS). As a matter of information, the WGS84 reference frame has migrated over the years to its present definition which is consistent with the International Terrestrial Reference Frame of 2000 (ITRF2000).

Multiple coordinates may exist for points by virtue of the changes in datums and re-adjustments over time of points on the Pacific Plate relative to the fixed North American Plate. The Pacific Plate is moving west-northwesterly relative to the North American Plate about 4 centimeters (0.13 feet) per year resulting in different positions being published for the same point on different epochs. The NAD83, 2007.00 Epoch adjustment is the latest in a series of adjustments of NAD83 since its adoption in 1986 and will be held fixed on future monitoring surveys. Although the Pacific Plate is moving relative to the North American Plate, this is not a problem for the purpose of this survey since the region of this survey is moving relatively the same as exhibited by the N, E, Up velocities on the CORS listed below as published by the CSRC.

Annual Velocities in Feet			
CORS	North	East	Up
PVE3	0.06	-0.13	-0.01
PVHS	0.06	-0.13	-0.01
PVRS	0.06	-0.13	-0.00
VTIS	0.06	-0.13	-0.01

In summary, the City as a whole is moving at a constant rate and the four CORS listed above serve as a rigid reference frame for monitoring the Portuguese Landslide.

FIELD SURVEYS:

Prior to initiating the field surveys a reconnaissance of the area was performed to identify access, recover previous monitoring points and assess suitability. Sixty points were recovered from previous surveys dating back to 1994. Nineteen new points were set at locations determined by Glen Tofani, City Geologist. Fifty-two of the recovered points and nineteen new points (71 points total) were monitored and reported in 2007 (shown below). The monitoring points were documented with photographs and recovery sheets that detail the location, character of the monument and obstructions of GPS observations.

AB01 has been used since 1994 as the primary Base Station. Over the years a pine tree northeast of the point has become an obstruction; therefore, a new GPS Base Station was established on Portuguese Point known as AB61. The location is secured behind a locked gate, has a clear horizon above 15 degrees (ideal for collecting GPS observations from satellites), and sits on a stable geological formation (location approved by Glen Tofani, City Geologist).

The field survey commenced each day by setting up a GPS receiver on a tripod at AB61 while two GPS receivers roamed freely collecting observations on fixed height poles at 70 on-site monitoring points. Many of the points are surrounded by mature trees and plants which attenuate satellite signals passing through foliage degrading accuracies. To obtain the highest possible accuracies, available satellite were compared in real time with the obstruction diagrams to estimate the best time and sequence for observing points. Upon arriving at a point to be observed the receiver was set up, the location in the sky of each satellite was estimated with a compass and abney, and satellites obstructed by foliage and trees were turned off. If 5 or

more un-obstructed satellites with a GDOP (measure of the geometry of the constellation) of 5 or less were available then the measurement commenced for 15-30 minutes of data collection. If sufficient satellites and geometry were not available then the receiver was moved to the next point and the point was returned to later. This process was followed until all points were occupied twice and sometimes three times under a different constellation of satellites with the exception of BB52 which was occupied once for an extended time due to high tides. BB53 was set as a backup for BB52.

DATA COLLECTION: EQUIPMENT & PROCESSING

Description: Network Control and Data Collection were performed by establishing a base receiver at point AB61 while two roving receivers occupied all points in a radial fashion. There were no equipment failures. See below for the GPS Survey Parameters.

Date of Field Surveys: 09/22/2007 to 09/26/2007 between 0600-1800 PDST (+7 hrs for UTC).

GPS constellation: Consisted of 29 Block II satellites

GPS Observables: L1 & L2 Carrier wave, C/A Code and P-Code; P-code was encrypted and SA was off

Epoch Rate & Occupation Times: 10" for 15-30 minutes and 10-11 hours for CORS connections

Minimum Satellites: 5 ; GDOP= \leq 5 ; Elevation Mask for Data Collection: 15 degrees; Processing: 15 deg

Ephemeris: Rapid for Static Post-Processing

Space Weather: Boulder K Index was 1-2 on a scale of 0-9 and gauges ionospheric activity.

GPS Base Receiver Unit No. M2, Operator: M. McGee,PLS; Station Identification: AB61

Make & Model: Leica 399 ; Antenna: Leica 399 Internal, Mount: Tribrach on Tripod; Height: varies

GPS Rover Receiver Unit No. M3, Operator: R. Reese,PLS,

Make & Model: Leica 530; Antenna Leica AT502; Mount: Fixed Height Pole #1; Antenna Height: 2.083m

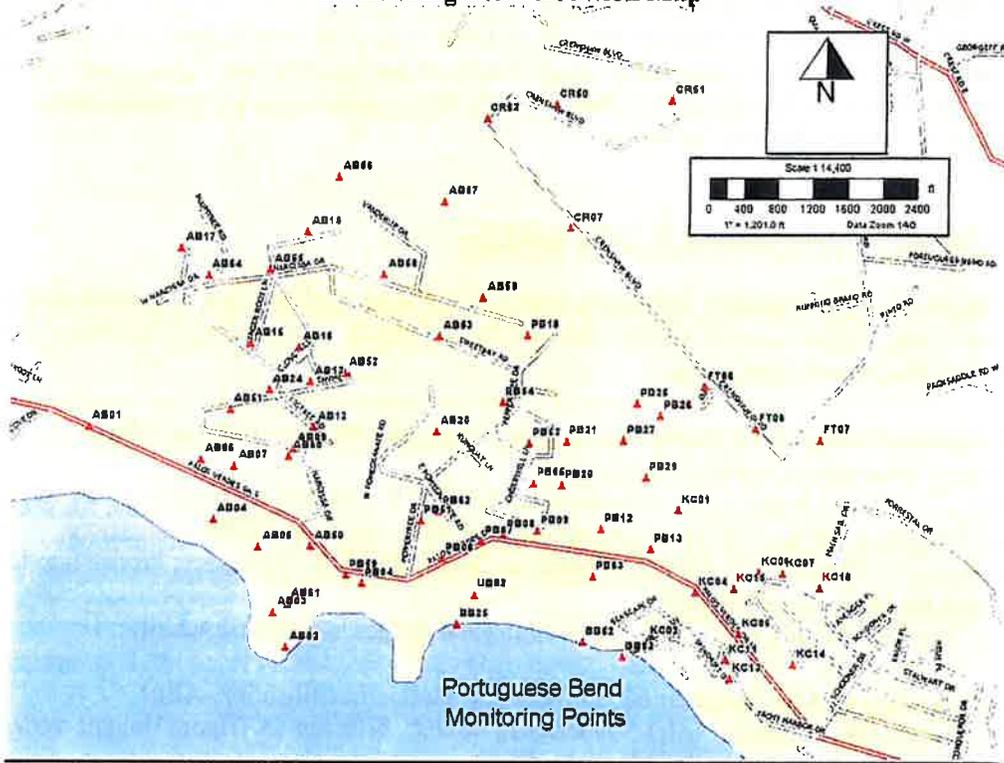

GPS Rover Receiver Unit No. M4, Operator: M. McGee,PLS;

Make & Model: Leica 530; Antenna Leica AT502; Mount: Fixed Height Pole #3; Antenna Height: 2.085m

Three Leica geodetic GPS receivers were utilized to collect, process and store satellite signal data. Units M3 and M4 components consisted of an Leica 530 receiver and AT502 antenna; and Unit M2 consists of a SR399 Sensor (antenna). Two, two meter fixed height poles were used for the field observations of the monitoring points with a base station receiver utilizing a tribrach on tripod setup. Prior to initiating the field observations a calibration of the tribrach and fixed height poles was conducted to verify the accuracy of the equipment. Weather conditions were generally clear skies and mild temperatures. Heavy showers occurred the evening before the field survey commenced, otherwise there was no precipitation for the many months since the rainy season. There were no equipment failures.

A total of 77 points (71 monitoring+2 miscellaneous+4 CORS) were connected with 181 measured vectors. Data was processed using the Leica "SKI-Pro" post processing software running in a Windows XP operating system. The baseline connections to the CORS were processed with a precise ephemeris at a cutoff vertical angle of 15° above the horizon. The network baselines were processed with a broadcast ephemeris at a cutoff vertical angle of 15°. Analysis of processing statistics and residuals led to the rejection of 5 vectors. Network adjustments and analysis were performed with "Starnet-PRO" version 6.0 software. The CORS stations were included by downloading Rinex files from the NGS and using the NGS antenna models in the processing.

Monitoring Point Location Map

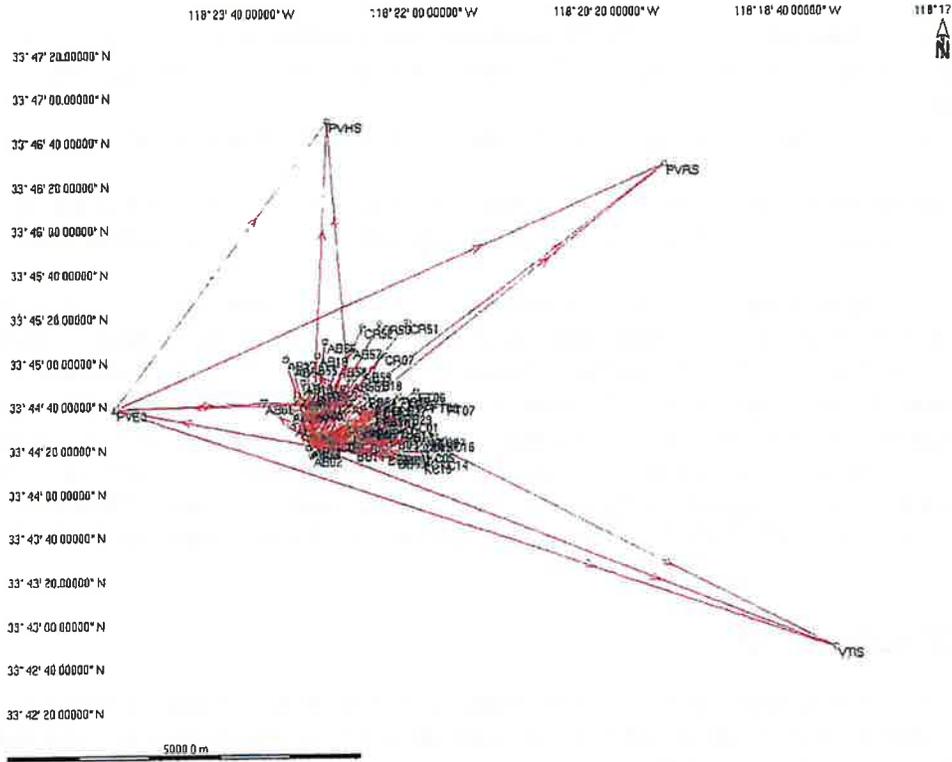

Monitoring Point Location on Aerial Photo

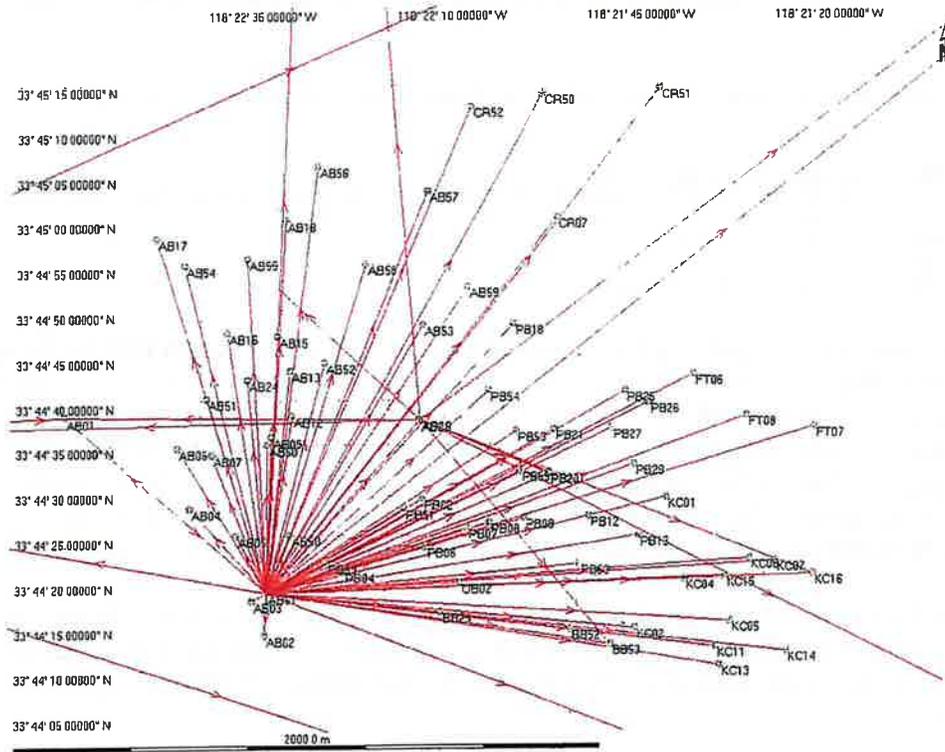

NETWORK

GPS Network

GPS Network Enlargement Showing Monitoring Points

Network: A new Base Station was established at point AB61 on Portuguese Point from which a static network was created including four CORS stations. The survey of was conducted as a radial static network from AB61.

Number of Points in Network: Four CORS, 71 monitoring points and two miscellaneous points (AB21 and PB201). These two points were located because they were in near proximity to monitoring points, but not used for monitoring.

Control Stations: Control stations are the four CORS taking their assigned four letter ID for use in this survey.

Point Status/Comments: Monitoring Points used in this survey take their ID from previous surveys. The ID of new points were assigned by the Glen Tofani, City Geologist consistent with prior naming conventions.

Since 1994, 149 monitoring points have been established in the Portuguese Bend area many of which are now lost or destroyed. Sixty of the original points were recovered in 2007. Eight of the 60 points were deleted because they were in close proximity of other better suited for GPS leaving 52 points monitored for movement between September 2006 and September 2007. Three of the 60 points (AB09, KC11, PB51) were monitored in 2007 for the last time and are replaced on future surveys by new points set nearby better suited for GPS measurements. Nineteen new points set in 2007 will have their movements reported beginning in 2008. In 2008, and moving forward, 49 original and 19 new points will be surveyed for a total of 68 monitoring points. See the "STATUS OF MONITORING POINTS" in the Appendix for information and status.

ADJUSTMENTS & ANALYSIS

Adjustment 1: Minimally Constrained to develop Geodetic and Ellipsoid Coordinates in NAD83(2007)

Fixed Control: The CORS PVE3 was fixed at its published three dimensional position in a Minimally Constrained Adjustment to determine latitude, longitude, ellipsoid heights, and State Plane Coordinates, and compare with other known points shown below. See the attached file "COORDINATE LIST-NAD83 2007 Survey.xls" for a list of points and coordinates resulting from this survey which will be the basis for computing future movements.

The 3D and Ellipsoid Height adjustment results follow with coordinate differences (closures) from record to computed in feet.

Station	dN	dE	dZ	
AB01	2.163	-2.560	26.077	Record WGS84 Position of historically Base Station
PVE3	0.000	0.000	0.000	Fixed
PVHS	0.004	-0.017	0.033	
PVRS	0.013	-0.011	-0.032	
VTIS	0.007	-0.003	-0.012	

Notes/Comments: Relative to the primary Base Station point AB61, the CORS station PVE3 is located 1.8 miles west-northwest, PVHS is 2.8 miles north, PVRS 3.9 miles northeast and VTIS is 4.9 miles east-southeast. The 2D closures on the CORS is 0.017 feet or less and for the purposes of this survey a constrained adjustment was not necessary as it would not change the values determined by this survey. Furthermore, the ongoing plan for the monitoring surveys is to fix AB61 and use the CORS to verify the stability of the reference system. The difference at AB01 indicates the position used historically is 2.16 feet S, 2.56 feet E and 26.08 feet lower than the NAD83 position determined by this survey.

The following lists the position of AB01 in datums of interest for this survey. Note, although AB01 is described in the historical records as a WGS84 position, it is 3.50 feet S, 6.69 feet E and 23.75 feet lower than its WGS84 position by the present definition. The historical WGS84 position of AB01 was apparently a navigation solution.

Point	Latitude	Longitude	EH (ft)	
AB01	33-44-38.30249	-118-22-53.05085	60.142	NAD83, 2007.00
AB01	33-44-38.31554	-118-22-53.09980	57.820	WGS84=ITRF2000
AB01	33-44-38.28119	-118-22-53.02044	34.065	Historical Record WGS84

Adjustment 2: Minimally Constrained to develop Orthometric Heights (Elevations) in NAVD88
Fixed Control: The CORS PVE3 was fixed horizontally and the CORS VTIS was fixed vertically in a Minimally Constrained Adjustment that combined the measured ellipsoid height differences with the NGS Geoid 03 (models the undulations between the ellipsoid and geoid surfaces) to determine NAVD88 orthometric heights on all points and compare with other known points shown below. See the attached file "COORDINATE LIST-NAD83 2007 Survey.xls" for a list of points and heights which will be the basis for computing future movements.

Orthometric Heights: The adjustment results follow with the height differences (closures) from record to computed listed.

Station	dZ (ft)	
AB01	2.56	NGVD29 Historical Record
PVE3		Not Available
PVHS	-0.1	
PVRS	0.0	
VTIS	0.00	Fixed NAVD88

Notes/Comments: The orthometric closure between VTIS (based on Second Order Leveling) and PVHS and PVRS is better than the stated accuracies of their published values. The difference at AB01 represents the shift from the historical record elevation on NGVD29 to the NAVD88 as determined by this survey. For the purposes of this survey a constrained adjustment is not necessary.

Adjustment 3: Minimally Constrained to develop Geodetic and Ellipsoid Coordinates in Psuedo-WGS84 (Duplicates 1994-2006 procedures)

Fixed Control: The historical record position of AB01 (33-44-38.28119, -118-22-53.02044, 34.065 feet) was fixed at its three dimensional position in a Minimally Constrained Adjustment to determine latitude, longitude and ellipsoid heights on the 52 points monitored in 2006 for processing in Corpscon. Consistent with prior processing methods, the results were imported to Corpscon v6 software as NAD83 positions and exported as NAD27 State Plane Coordinates Zone 7. See the attached file "FULL DATA-THROUGH 2007-NAD27.xls" for a list of grid coordinates and movements.

Adjustment 4: Minimally Constrained to develop Orthometric Heights (Elevations) in NGVD29 (Duplicates 1994-2006 procedures)

Fixed Control: The historical record elevation of AB01 (176.06 feet) was fixed vertically in a Minimally Constrained Adjustment that combined the measured ellipsoid height differences with Geoid 03 (models the undulations between the ellipsoid and geoid surfaces) to determine NGVD29 elevations on the 52 points monitored in 2006. See the attached file "FULL DATA-THROUGH 2007-NAD27.xls" for a list of elevations and movements.

Comment on Heights: Analysis of past records indicates as far back as 2000 ellipsoid heights were used to calculate elevations on monitoring points. In 2006 the Geoid 99 model was apparently used. This adjustment derives elevations consistent with past practices but used the newer Geoid03 model. The difference between Geoid99 and Geoid03 heights varies 0.02 to 0.04 feet; however the relative point to point differences affecting this survey are less than 0.011 feet in height and are ignored.

Comment on Recovery of Reference Frame: Points AB02, AB03, AB17 and CR52 are considered historically to be stable and the horizontal closures of 0.01 to 0.03 feet on the 2006 record positions (Adjustments #3 and #4), are listed below and indicate the previous survey reference frame relative to AB01 is stable at the level indicated and was recovered successfully.

Point	N	E	Up	
AB01	0.00	0.00	0.00	Fixed
AB02	0.00	-0.01	-0.08	
AB03	-0.03	0.00	0.00	
AB17	0.02	-0.02	0.00	
CR52	0.01	0.00	0.01	

ACCURACY

Relative Accuracy: On site the points are expected to be at 0.02 feet (<1 cm) horizontal at the 95% Level of Confidence.

Absolute Accuracy: The network is expected to be less than 0.02 feet (<1 cm) horizontal at the 95% Level of Confidence relative to the NAD83 Datum based on the PVE3 CORS as fixed in Adjustment #1.

Vector Residuals: Adjustment #1 referred to above was processed with the following results: the two dimensional horizontal residuals average 0.01 feet with a standard deviation of 0.01 feet and a maximum of 0.03 feet. The absolute value of the vertical residuals average 0.01 feet with a standard deviation of 0.01 feet and a maximum of 0.06 feet.

The North American Vertical Datum 1988 orthometric heights (elevations) resulting from Adjustment #2 are derived from the GPS ellipsoid heights combined with the Geoid 03 model and constrained to known elevations. The ellipsoid heights are expected to be within 0.03 feet. The Geoid 03 model is expected to have a probable error of 1 part per million. Relative elevation accuracies are expected to be 0.03 feet. The absolute accuracy of these heights is dependent on the published values on the VTIS CORS.

In the Minimally Constrained Adjustment #2 the average Standard Deviations (68% Level of Confidence) of the monitoring point coordinates follow in feet.

	North	East	Up
Average	0.008	0.006	0.017
Maximum	0.014	0.012	0.038
Minimum	0.002	0.002	0.003

Baseline (vector) precisions for the monitoring points, at the 95% Level of Confidence (2 sigma), vary 2 ppm to 77 ppm and average 7.5 ppm for 76 measured vectors varying in length between 192 feet and 7,182 feet and averaging 3500 feet. The relative distance error at the 95% Level of Confidence averages 0.017 feet with a maximum of 0.032 feet. The precision ratio based on the averages is 1:206,000 exceeding the criteria for a First Order (C-1) survey per the FGCS requirements by a factor of two under the former classification system.

Baseline (vector) precisions between AB61 and the CORS, at the 95% Level of Confidence (2 sigma), vary 0.1 ppm to 0.5 ppm and average 0.3 ppm for 7 measured connections varying in length between 9,395 and 35,385 feet and averaging 20,700 feet. The relative distance error at the 95% level of Confidence averages 0.005 feet with a maximum of 0.006 feet. The precision ratio is 1:7,000,000 exceeding the criteria for a B Order survey per the FGCS requirements for the former classification system..

CORS connections in feet

From	To	Grid Distance	95%	PPM
AB61	PVE3	9395.7221	0.004	0.5
AB61	PVHS	14914.8779	0.006	0.4
AB61	PVRS	20693.1014	0.006	0.3
AB61	VTIS	26103.4525	0.005	0.2
PVE3	PVHS	16379.9943	0.005	0.3
PVE3	PVRS	27759.1021	0.005	0.2
PVE3	VTIS	35385.8424	0.005	0.1

The residuals and the closures between known control points discussed in the above Adjustments are good indications of the accuracies obtained by this survey. This survey conforms to the intent of the Federal Geodetic Control Subcommittee (FGCS) Specifications for GPS Relative Positioning (1988) and the California Geodetic Control Committee (CGCC) Specifications for High-Production GPS Surveying Techniques (1993).

QAQC ANALYSIS

To ensure the accuracy of GPS, an independent validation of the measurement system was performed by measuring the distance between a sampling of five inter-visible points with a conventional calibrated total station. The results are listed below in feet. Distances are horizontal ground distances and the "95%" column indicates the relative confidence of the computed GPS distances at 95%.

Comparison of Computed GPS Distances v. Direct Conventional Measurements (Total Station)

From - To	GPS Dist	95%	Total Station	
			Distance	Difference
AB02 - AB61	477.964	0.016	477.973	-0.009
AB03 - AB61	191.838	0.015	191.854	-0.016
KC06 - KC07	288.562	0.020	288.577	-0.015
KC07 - KC16	443.143	0.019	443.149	-0.006
KC11 - KC13	219.804	0.027	219.814	-0.010
Averages		0.019		-0.011

The differences of the computed distances between positions obtained with GPS and distances obtained with direct conventional instruments average 0.011 feet. The maximum is 0.016 feet which is better than the average of 0.019 feet at the 95% Level of Confidence. This test indicates that GPS techniques are equivalent to conventional measurement systems that would require a much greater amount of time and costs to perform.

A second validation was made by computing the inverse distance between the GPS positions of AB20 and five other points spread across the site and then comparing with the directly measured GPS vectors introduced into the adjustment and comparing the change in the distance.

Comparison of Computed GPS Distances v. Direct GPS Measurements

From - To	Calc'd Dist	Direct Dist	Difference
AB20 - AB55	2651.000	2650.995	+0.005
AB20 - AB61	2573.293	2573.296	-0.003
AB20 - BB53	3322.413	3322.423	-0.010
AB20 - KC16	4749.444	4749.448	-0.004
AB20 - PB20	1562.957	1562.966	-0.009
Average:			-0.004

The difference in the distances average -0.004 feet with a maximum of 0.010 feet. This test indicates relative accuracies are better than 0.010 feet. This test, consistent with the above test results, indicates the radial method of positioning monitoring points is reliable at 0.01 feet, more than sufficient for monitoring purposes.

SUMMARY

For the historical status of all monitoring points as of September 2007, see the "STATUS OF MONITORING POINTS" in the Appendix. The historical positions of all points between 1994-2006 are listed in the file "ALL POINTS MOST RECENT OBSERVED POSITION AS OF SEPTEMBER 15, 2006.xls" available on CD due to its large size.

Generally, between 2006 and 2007 the points in the "Portuguese Bend Landslide" moved about ½ to 3½ feet. Points east and west of the "Portuguese Bend Landslide" moved about 0.1 feet or less. The movement for the present period between September 2006 to September 2007 for each monitored point is listed in "FULL DATA-THROUGH 2007-NAD27.xls". The overall movement since the beginning position (varies between 1994 and 2005) is also listed in the same document. The movements are given in north, east and up or down as well as a vector of distance and direction. The direction is given as an azimuth in degrees where 0° is north, 90° is east, 180° is south and 270° is west.

The overall movement of point BB25 is referenced to the 11/04/1998 position because the position changed 6 feet west of its first reported position on 12/13/1997 indicating a different point may have been used. At KC01 it was observed that the recent annual 2006-2007 movement was S19°E 0.05'; however, the 9/14/2006 position is N29°E 1.24' and down 1.8' from the 12/9/2005 position. The 12/9/2005 position is 1.5' higher than its previous position in 02/09/2005, otherwise the point has been stable between 1994 and 2005. This may indicate two points have been used for KC01 and will be resolved with the next survey.

Analysis of the historical data for AB02, AB03 and AB17 (considered stable points) indicates the probability that movement has occurred in the past reports when the distance is greater than 0.05 feet and the direction is consistent with the direction of the overall movement for a particular point.

The September 2007 survey used refined field procedures and processing techniques, the benefits of which will be realized at the completion of the 2008 monitoring survey. At that time, a rigorous simultaneous adjustment that combines the results of both surveys is expected to determine the movement reliability to better than 0.03 feet (1 cm) at the 95% Level of Confidence. Beginning in 2008, the spreadsheet "FULL DATA POSTING 2007-NAD83.xls" will be used to report overall and period movements in the NAD83(2007) coordinate system.

SURVEYOR'S STATEMENT

This Report on the criteria, procedures and results of the Rancho Palos Verdes Portuguese Landslide Monitoring Survey were prepared by me March 30, 2008 at the request of Frederick (Rick) Jones; P.E., P.L.S. of Charles Abbott Associates Inc. and City Engineer of the City of Rancho Palos Verdes.

Michael R. McGee
P.L.S. 3945

Frederick (Rick) Jones

COORDINATE LIST-NAD83 All Historical Pts

Date: 03/30/08

PORTUGUESE POINT LANDSLIDE MONITORING

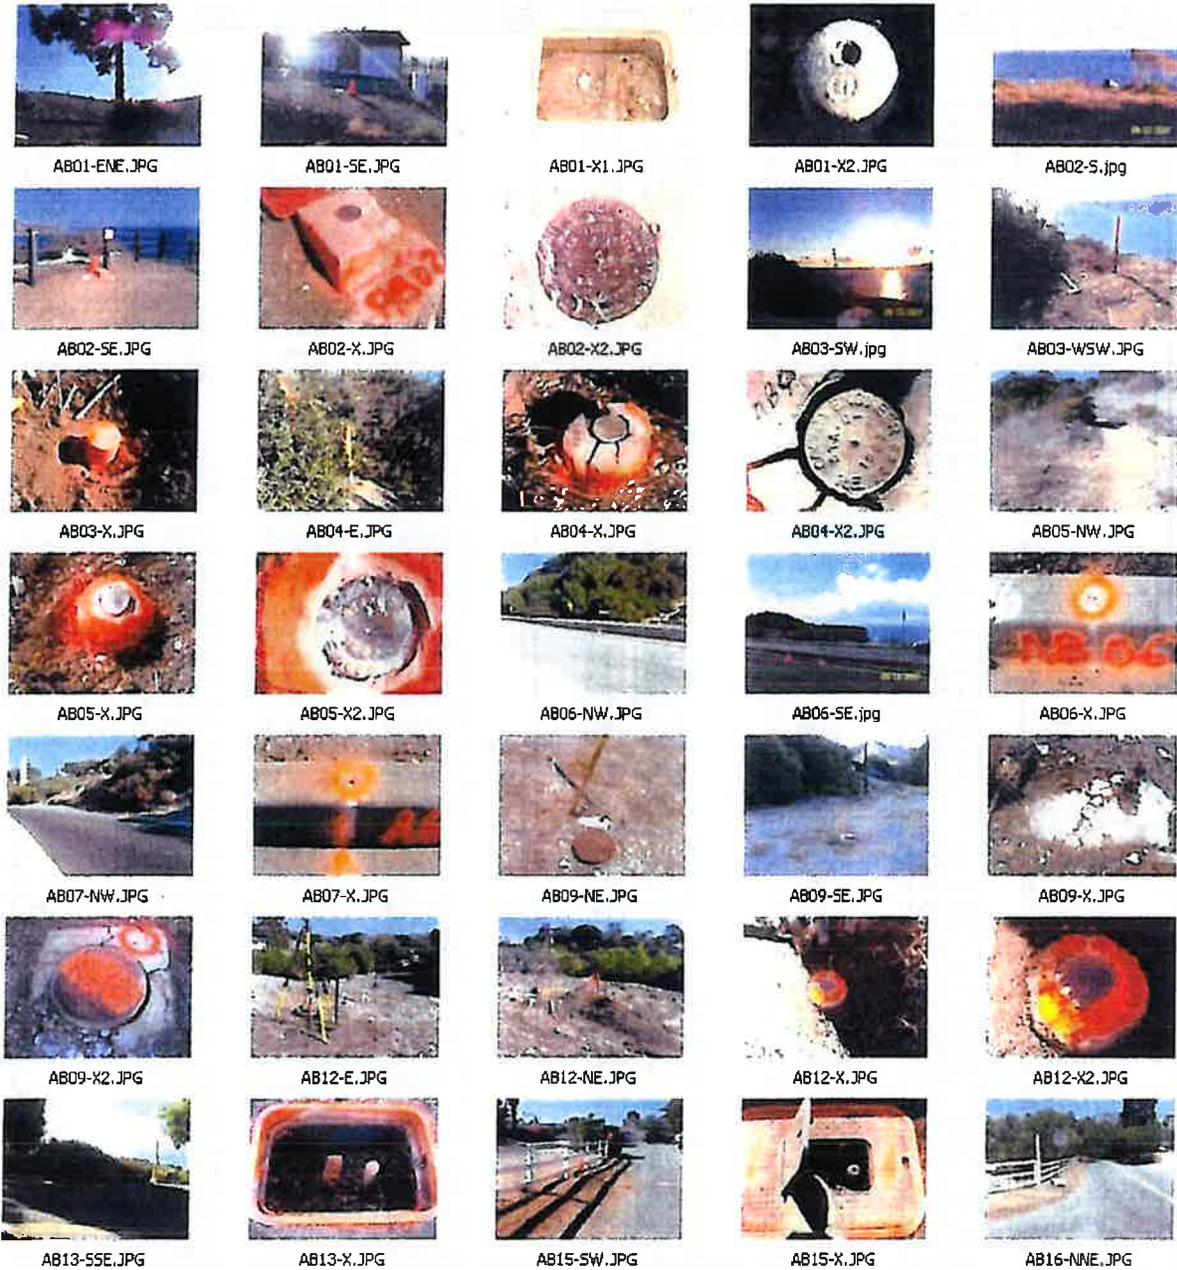

COORDINATE LIST of the INITIAL POSITIONS of ALL HISTORICAL MONITORING POINTS in NAD83(2007)

Datum: Horizontal NAD83, 2007.00 Epoch; California State Plane Zone 5; Based on a 2D conformal transformation from NAD27 at points AB01,AB02,AB03,AB17,CR50,CR52 and KC11. Heights are translated from NGVD29 to NAVD88 at AB01
